I have a military AM modulation transformer that I would like to use in a low power AM transmitter I am building (25 watts). The question is: The transformer has a single center tapped coil and is intended for push pull modulation. One leg of the coil has a much higher current rating than the other (70 ma vs 150ma) this is the end that would be connected to the plate of the final amplifier stage of the transmitter. Does anybody have any schematics for this type of modulation. I suppose it is similar to a Heising configuration except that the modulation drive is double-ended rather than single.

Chris:

Years ago before electronic ignitions I used to run my spark plugs for many miles, until they needed replacing because the end of the hook had been burned off. I re-gapped them only when they needed to be gapped.

I could tell when the plugs needed re-gapped driving on the highway. When I went up hill and pressed on the accelerator, the engine would loose power. Re-gapping the plugs always fixed that problem. Made me think that when I pressed on the accelerator, a higher voltage was needed to make the plugs fire!

This effect shouldn't cause a hash noise, but maybe your RFI is related to that effect???

Just a thought, but I wonder if anyone has experimented, changing the spark plug gap to see if it changes RFI? Comments anyone?

To email me, use the address below, not the one above!

Thanks for the comments. By our measurements the typical user operating at 21,600 to 28.8 kbps loads the main page in 20 to 30 seconds; at 14.4 kbps you'll see about 45 to 60 second loads. A 14.4 modem is our target user. However, the actual load time varies depending upon server load and Internet traffic. We rent our server space at AccessOne in Kirkland WA. They connect to the Internet over two T-1 connection (1.544 mbps each).

Depending on your browser, you may be able to disable the display of graphics or ensure that your browser caches images so that they do not need to be downloaded each time. My browser also lets me page up and down and read pages before the entire page has been loaded. This let's me select things to read without necessarily waiting for the entire page to load.

We are also in process of setting up the web site on a new ISP that may have higher performance. We'll post a message when that becomes availble - probably its a month out at least.

We know that as our hobby web site has grown, the size of the pages has also grown. We've redesigned the web site twice since starting and its time for another redesign to accomodate the increased content.

We would like to do a redesign some time but that's easier said then done. We run this web site solely as a hobby. My real job typically uses up 11 hours a day of my time; we've got 3 small kids. And other time pressures too. Sometime we will change the page design again but I would not expect more than perhaps a 1/3rd reduction in download time.

Hi again Peter, I was thumbing through "Reflections" at the barber shop today and came across the following: Per 100 ft of 75 ohm 1/2" hardline on 440, the matched line loss, ie with an SWR of 1:1, is 2db. With an SWR of 1.5:1 it is 0.1 db worse, ie 2.1 db. Moral: don't even for a minute worry about the mismatch. An SWR of 1.5:1 is near perfect!!!

I remember an article in 73 magazine that used a microwave oven for atv
transmission. I remember that the magnetrons were locked on freq with an
injection oscillator or a simple PLL. For some reason it was necessary
to remove the bypass caps on the filament lines of the magnetron. good
luck.

Source record: 105012
Cross-posted to: aus.electronics,aus.radio.amateur.misc,rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.misc

Hi
Can anybody tell me how I can calculate the overall input
and output third order intercept points (IP3), as well as
the intercept point for each stage, given several stages.

I would also like to calculate the intermod product levels
(IP3) for each stage.

When not stated, do manufacturer's IP3 figures usulay refer
to input or output ?

Although I am able to find many references calculating
cascade noise figures, none deal with the above.

Formulae, worked examples or pointer to recommended texts
would be much appreciated

Replies to sjandrew@ozemail.com.au please.

Thanks in advance..

Steve Andrew

>Hi Chris, I have begun to suspect the ABS system is causing a
>similiar problem in my S10. Does anybody know if the clutch
>position is sensed by the ABS?

I don't know much about ABS, but I do seem to remember something
about fuel injection that has to do with the way some systems
meter intake airflow. If I'm not mistaken, they use a heated
wire at the input to the metering unit, and airflow is determined
by measuring the current change through the wire. As more air
flows, the wire becomes cooler and more current flows. This is
computed in conjunction with ambient air temperature and other
factors in order to arrive at instantaneous calculations of
airflow. Also, if I'm correct about the system, this particular
function is cut off during idle, at which time radiation from the
metering unit decreases. It's possible this might also be linked
to the clutch, as airflow metering is not so critical at no load,
even when the airflow valve is opened to accelerate the engine.

Perhaps someone more knowledgable with current designs will know
whether this system is still in use, and whether I'm correct
about the way it works.

I suggest writing to Motorola and asking for information on their
AM stereo detector chips. They include (along with other circuitry you
could leave out for your purposes) a synchronous AM detector.

If you are seriously interested in developing a product, they might even
send you some free chips to play with.

Let me know how it goes.

With best wishes,

3488. How do you make a 7 ns. delay line @ 146 Mhz?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-02 00:00:00 UTC
From: mike@sneezy.UUCP
Message-ID: <L6BwoD1w165w@uudell.us.dell.com!sneezy>
Source record: 104931

Somebody here might know how to do this. I want to make about a 7ns delay line inside an inch square and a quarter inch high on a PCB. Frequency bandwidth is 140-150 Mhz and any Z will work. I'm thinking of the distributed L-C type.

Is there any information about how to do this?

Maybe SAW chips would work. Is there a primmer somewhere? Where could I get them at this delay? Who makes them?

Maybe I could make a serpentine etch on a PCB?

All info/pointers/experience/programs etc cheerfully accepted.

This will be used in a wideband FM Rx using a NAND gate discriminator for linearity and no adjustments.

Email or Post is fine. Use address below for email though!

> on 144 and 440 mhz?

This is not a url, but will provide a solution to your
problem, nonetheless.

Find or construct two, one-quarter wavelength (at 144 Mhz)
long, low loss, coaxial cable assemblies having a characteristic
impedance as close to 62.4 ohms as possible. Connect one of these
cables to each end of your CATV cable. You will have a
completed line that will be matched to 52 ohms at each end.
The two, quarter wavelength cables act as transformers to
match the impedance of the CATV cable to the 52 ohm source and
load impedances. The completed cable with match well at 440
Mhz also, because 440 Mhz is nearly an odd multiple of 144
Mhz. This setup will also be broadband enough for the two
amateur bands. Any length of CATV cable may be used.

A previous post stated that the CATV cable could be used alone
without any matching. I do not agree. If the length of
the cable is an even multiple of one-half wavelength at
the frequency used, then a feed with *any* characteristic
impedance could be used. Otherwise (except for a 52 ohm feed),
depending on the actual length, the match could be *awful*.
Even if the CATV line is cut to an even multiple of one-half
wavelength at one of the bands, it would not be unsuitable for
both bands since the two bands are not even multiples of each other.

The ARRL picked that up, and ran it in their "Handbook" for a few years. It's not in the 1996 one, though.

However, it is in another ARRL publication; the title is something like "Packet Radio: Speed and More Speed" or something similar.

With some hesitation as there are quite a few expert receiver designers lurking here, here are some thoughts, reports, musings on this topic as there has been a recent thread started....this is really loose.

Went to a bunch of seminars at Dayton this year:

Don't remember who said it, but supposedly the Cohn minimum loss filters are easy to design but are very critical and mimimal component variation will quickly turn one into a very lossy filter.

Bought ARRL Radio Designer and soon found that I couldn't access the schematic capture part so didn't follow up on that yet. (A joke I think!) Back to Hayward's excellent ladder program with optimize and the latest version of P-Spice. Will play with the variation problem when the snow flies.

Then stumbled into an excellent presentation at Stauffer's for the DXers given by JA1RPK on design of the new TS-870S. He has been involved in design of every rig since the TS-120 and is the Engineering Manager on this rig. Unfortunately, they had a bar at the back and all of the big DXer were in the back talking loudly and comparing their big ....s, and every time another round of drinks was received or another big .... came in, the noise level went up. About 30 of us were huddled around the overhead projector trying to hear Mr. Kawana's presentation and I really was embarrased by the behavior until he mentioned that he was used to working 20 DX! Some pearls:

After an infomercial, he emphasized that there was a big difference between integrated DSP and the add-on boxes. Largely in the AGC. The boxes reject signals that pump the AGC and you wonder why the signals sound funny. (Although in one of my first attempts at RX bldg, an early stage was overloading and the filter kept it from the AGC)

They tried using direct conversion (I'm not certain if to AF or a low IF) with minimal filtering...worked with a commercial RX, but not good enough for the ham bands! And they are using two 2 ea 56002 Moto DSP's running at 40 MHz. (Rockwell has announced..in Microwaves and RF, May 96, p. 23) a newdirect conversion RX for some fighter program...use of direct conversion DSP "reduces unit prices from $50,000 to $38,000". wonder about multisignal performance?)

So Kenwood uses the typical upconversion to 73.05 MHz using 4 ea 2SK520 devices....no schematic so wonder if a switching mixer? Then to 8.83 MHz for 6 and 3 KHz BW filtering (as well as bypass mode). He emphasized that you didn't want too good (narrow?) of filters here as it messed up the AGC and ringing. Then to 455 KHz for 15, 6, and 3 KHz filtering (Rockwell mechanical filters I seem to remember) Then to 11.30859375 KHz for DSP processing. Sounds to me like a lot of mixers, each with some added intermod.

They use some 18 bit A/D (SK5340) sampling at 45.2349375 KHz. After DSP the data goes to 3 D/A converters used in the CD industry to get back to audio. All calculations are in 24 bits which has a dynamic range of 144 dB. There was some discussion on this.

I suspect that the filters used are IIR as their "In Depth Manual" states "In fact, with superior circuit design skills and DSP processing power available, one can desigh IIR filters with sharp characteristics yet with group delay distortion reduced to the level one finds with FIR filters".

He was really proud of their AGC. It works with a one bit D/A (proprietary) that gives exceptional performance. (I earilier thought of using the most significant bit of the A/D to pulse the AGC so that each time you were about to overload the conversion, another pulse would lower the gain very rapidly. Of course, then you need to get it to decay.) He described a strong signal that masks the desired signal...when it stops, their AGC brings up the gain very rapidly so that you can pick up a bit of desired signal before others can hear it.

A graph in the manual shows 14.100 dynamic range of 108.6 dB with an IP of +32.7 dBm with Noise floor of -130.2 dBm in the 400 Hz filter mode.

It looks like a great rig with anything you could want..keyer..etc., but will stay with the 940 for a while and keep building.

Strays:

I have a couple of the AD600 series devices. Has anyone actually seen any dynamic range type measurements on these. The concept of attenuator switching is great, but wonder what non-linear devices do the switching, especially the slider?

Then too, why not just oversample at 455 KHz (the Moto chip will handle that) and decrement the data?

I bought one of the AD 9850 eval boards. Gee, no onboard clock..picked up a 120 MHz one at Dayton to plug into the place provided. No filtering or buffering provided. Of course, anyone doing evaluation would want direct access. And the advertised Windows program lets you enter the clock freq, the desired output rreq and has a slider for output phase. That's just a few lines of basic which I had to do to use it to scan up and down the sides of some filters to look atspurs. No high tech spectrum analyzer here.

Sorry this is long, butthought a few might want the info.

Please don't shoot the messenger.

>end of the coil will be operating at an impedance of 50 ohms,
>which represents an RMS voltage of 71 volts. Thus, the coil will
>see a differential voltage of 275 volts.

Nada. There is a phase difference being negelected. The peak voltage
across the coil is a complex issue that involves the actual operating
parameters of the network. The phase difference across the input and
output voltages is probably somewhere between 90 and 180 degrees, and more
likely at the 180 degree end.

You will also have an operating Q related problem. The current and voltage
are no longer in phase, VAR power in the tank can be many times higher
than the output power.

Hello,
I am interested in building a tube amplifer for my HF rig (Kenwood TS-940). What is either a good
book to read to help me understand how to build one and/or a good project already designed to help
me accomplish this task. I'm not in a rush to have this amp, it's more of something to keep busy.
HiHi...Thanks in advance.

MITO>probably stainless. Is there a flux for soldering stainless?

You can solder most any ferrous metal, I have soldered stainless and
cold rolled steel, both with good success. Stainless is a bit more
difficult, just get it clean, rough it up with a file or emery cloth and
use flux. If you do good with normal electronic soldering you should
have no problem doing this.

The same plans one might use to buid a "Baycom" modem should work. Then look to the standard ftp sites for "SoftKiss" to turn the Mac's serial port into a KISS TNC. A commercial package called Savant was once available but now NET/Mac is your best bet. Find Net/Mac at all the usual places. But you might start at ftp.ucsd.edu:/hamradio/packet/tcpip.

> or just the distance which would make it impossible for a signal to
> stretch beyond a given distance.

That's pretty much what a lot of ham radio is all about. How far can
you push an radio signal, given the physics (and luck) of transmission.

Okay, so in a nutshell:

Typically, radio signals in the range of commercial FM radio (88-108MHz)
travel line of sight. "Line of sight" in radio, means something
different - it ain't necessarily a straight line. VHF and above tends
to travel in a curve equivalent to 4/3 of the earth's curvature. This
is because the density of the atmosphere changes as you go higher (I
have seen situations where signals actually curved the other way - such
as temperature inversions over the LA Basin). So it's simple - get your
transmitter, and receiver, high enough so that there is a path between
them equivalent to 4/3 of the earth's radius, and there will be path
between them.

So, keeping that in mind, what else effects VHF propogation? Tons of
things. There somewhat rare situations when VHF "skip" propogation is
possible due to changes in the upper atmosphere that prevent VHF signals
from passing out into space. In these situations the signal acts
somewhat like shortwave and propogation is well beyond line of sight.
Such changes can be brought about by meteor showers and such, and hams
often refer to the phenomena as "sporatic E". There is also an effect
called "tropo scatter", where a sufficently powerful transmitter, and a
sufficently sensitive receiver are directed to a common volume of air in
the troposphere. Folks are still arguing about why this works, but it
does.

Finally, over mountains, there are several effects, mainly do to the
refractive effects of waves when something get's stuck into the middle
of them. "Knife edge refraction" is an example, and can be demonstrated
in a pool of water by starting waves going, then putting a stick in the
wave front. The waves tend to "bend" around the obstruction.

Wow, propogation 101... Hope this helps.

I've heard a Mexican radio station up in Santa Barbara and I'm
quite sure they don't use a repeater. VHF radio waves can propagate
that distance (~250 miles) if the conditions are right.
The more power they have the less "right" the conditions have to be.
(Try VHF contesting sometime!) I'm sure that station in Tijuana has
plenty of kilowatts.

The usefulness of this approach will depend on A) how abruptly
the noise energy must end at 10 & 30 Hz, and B) how accurately
the energy between 10 & 30 Hz must comply with the technical
definition of white noise.

It would be interesting to know more about the purpose of
generating this particular "signal".

I had some time tonight. I redesigned the main web page for faster download times. At 21,600 bps, the main page downloaded in 15-20 seconds. The newsletters, propagation and start/welcome sections have been simplified and moved to their own pages accessible off the main page. Everything is still there - just moved to new locations.

The main page has (at the moment) 3 graphics: the Ham Radio Online title banner (highly compressed JPEG at about 8kbytes), a picture of the Yaesu FT-50R (JPEG compressed at about 3.7 kbpytes) and the background graphics (4 kbytes). The overall text is about 12 kbytes, plus maybe another misc 2 kbytes (EFF logo, WA logo). That works out to about 30 kbytes total for the main page which should download quickly at 14.4 kbps. As soon as the 12 kbytes of text (hronline.htm) is downloaded, your browser should allow you to scroll around, even if the graphics are still coming in. 12 kbytes ought to download in 10 to 20 seconds depending on your modem speed, server load and Internet traffic.

Please write us at vbook@vbook.com and let us know what you think of the new design.

The 60,000 ft. altitude limit is built in by the manufacturer. For
some strange reason, the US government didn't want Saddam Hussein
buying a couple of thousand off the shelf consumer GPS units, mounting
them in SCUD missiles and dropping them into Tel Aviv with 300 foot
accuracy. At 60,000 feet, the NMEA output zero's out the data.
However, some GPS modules can be bought without the altitude limit...

Source record: 105023

About a year ago, I was trying to remove the last vestiges of noise in my mobile scanner. (admittedly a crazy-making experience).
I reasoned that the high voltage, in the spark plug arc, would make a smaller "signal" if it was lower in voltage. Since I couldn't change the compression ratio of the engine, or the laws of physics, I re-gapped the plugs to a smaller size (.043 to .028 inches).
I know this also changes the freq. at the spark, but it did exactly what I wanted on the spark noise. It reduced that particular component of the noise by about 50%.
I would add that I was attempting to get rid of the noise in the lower, say 49 MHZ, ranges. I had had no problem in the higher freqs. with spark induced noise.
I did not make my car harder to start by "shadowing" the spark. I used an old racers trick of grinding back the side electrode at an angle, thus exposing more of the spark to the cylinder gases.
Champion actually makes a plug with that configuration.
I would have tried 'split-fire' plugs in this experiment, but they don't make them for my automobile. If anyone has tried them for this purpose, I would like to hear about it.

I didn't realize hams were using high-level modulation for ATV.
This obviously produces double sideband, not vestigial sideband
as used by broadcasters. Is double sideband transmission typical
of Amateur TV transmissions?

>core be required, or could a smaller one be used, or would the
>T200-2 even be sufficient?

I haven't built one of these, but I'll offer a procedure that I
think is a reasonable way to roughly verify the core size.

At 700 volts/300 ma plate input, E/I equals 2,333. If we assume
that the conduction angle is 50 degrees, the operating impedance
will be 1,167 ohms. I'll round this to 1,200 ohms. For 100 watts
output, this represents an RMS voltage of 346 volts. The output
end of the coil will be operating at an impedance of 50 ohms,
which represents an RMS voltage of 71 volts. Thus, the coil will
see a differential voltage of 275 volts.

Now, let's say that we need 3 uH for this inductor. A T-200-2
core (u=10) with 16 turns will provide this value. Calculating
for flux density with the Amidon formula gives 41.4 gauss, which
is within their recommended maximum of 57 gauss at this frequency
(based on overheating). Using this same technique, the coil will
require approximately 0.8 uH on 10M (8 turns), which yields a flux
density of 20.7 gauss, well within the recommended maximum of
30 gauss at 28 MHz.

Again, I haven't used a core in this manner, so there may be other
factors involved in an exact determination that I'm not aware of.
However, I think this is sufficient to get into the ballpark in
selecting an appropriate core size.

>If you wanted to make a multi-band output network (with tapped
>coil), would you need to size the core for the highest operating
>frequency (assuming similar tube operating point for each frequency)?
>
>Any advice appreciated,

My advice is not to do it. With a single tapped coil, you end
up either shorting the turns, which severely reduces the Q and
increases loss (and which cannot be calculated with the Amidon
formula), or you will have open turns, which develop high
voltages and will probably arc.

The proper way to use toroids in this application is to design an individual inductor for each band, although you might get by using one core for every two bands (as long as switching doesn't short the unused turns). When it's all said and done though, you'll find that a single, air-core coil takes up less space, is more efficient, offers better harmonic suppression, and is much less costly.

73,
Jack WB3U

*****ARRL NEW ENGLAND DIVISION SPECIAL BULLETIN 96-9A*****

QST to all Amateurs

May, 1996

Strafford, VT

NEW ENGLAND DIVISION DIRECTOR NEW ENGLAND DIVISION VICE DIRECTOR
Bill Burden WB1BRE Warren Rothberg WB1HBB
wb1bre@arrl.org wb1hbb@arrl.org

********** 2 Meter AND 70 cm BANDS THREATENED **********

THIS IS NO JOKE!! ARRL HAS LEARNED THAT IN PREPARATION FOR THE
WORLD RADIO CONFERENCE IN 1997, REPRESENTATIVES OF THE LOW-EARTH-ORBIT
(LEO) INDUSTRY PROPOSED A LIST OF CANDIDATE FREQUENCY BANDS FOR
REALLOCATION TO, AND EXCLUSIVE USE OF THE MOBILE SATELLITE SERVICE. THIS
LIST INCLUDES 144- 148 MHZ (THE CURRENT AMATEUR 2 M BAND) AND 420-450 MHZ (THE
CURRENT AMATEUR 70 CM BAND)!
IF THIS EFFORT WERE TO BE SUCCESSFUL, IT WOULD MEAN THE END OF
AMATEUR OPERATIONS ON THESE TWO MOST HEAVILY UTILIZED AMATEUR VHF/UHF
BANDS!

I have included the text of Dave Sumner's upcoming editorial for
July QST in this bulletin. ARRL, as the principal representative of
Amateur Radio in Washington, is actively pursuing this issue as this
bulletin is being written. Dave's call to action is serious!! We could lose these bands if
we do not take action now!!
Club presidents and newsletter editors: please make this
information available to your membership as soon as possible.

Follows the text of Dave Sumner's July QST editorial:

WRITE NOW!!!!

Get out a pen and paper, or boot up your computer. There's work to be done! Your help is needed to defend two meters and 70 cm. Yes, that's right -- the two most popular and crowded amateur VHF/UHF bands! But don't panic, and don't "go ballistic."
Here's what's happening, and what you can do about it.
The United States is preparing for the 1997 ITU World Radiocommunication Conference, WRC-97. In the past, the public has been able to participate in the preparations for such conferences by responding to FCC Notices of Inquiry. In March, the FCC announced a streamlining of its International Bureau's preparatory processes for WRCs. Under the new scheme, the NOIs have been eliminated in favor of increased emphasis on WRC Advisory Committees.
For WRC-97, a series of Informal Working Groups (IWGs) of the Advisory Committee has been created to address specific agenda items. The output of each IWG will go directly to a joint FCC-NTIA-Department of State Steering Committee of the Advisory Committee. There, draft proposals as received from the IWGs will be reviewed and forwarded to the FCC for possible release as preliminary U.S. proposals for public comment.
In announcing the streamlined WRC preparatory process, the FCC tried to reassure those who might be concerned about reduced opportunities for public participation: "Interested parties should note that input to the Advisory Committee may be sent at any time directly to the Chair of the WRC-97 Advisory Committee; the Chairs of the Advisory Committee's Informal Working Groups; Cecily C. Holiday, the FCC's federal officer of the WRC-97 Advisory Committee,on C. Ladson, the alternate federal officer."
Hold that thought while we shift gears to the substance of the issue.
One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile- satellite service. So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL technical relations staff participates in IWG-2A to represent Amateur Radio interests.
At the May 7 IWG-2A meeting, an industry representative proposed a list of "candidate bands" for little LEOs. The list includes a number of bands that would negatively impact existing services, and does not include others that would be technically
more feasible but to which strong objection from incumbents could be expected -- the point being
that some political, rather than purely technical, judgment already has influenced the list.
Incredibly, 144-148 and 420-450 MHz were included on the list! This is the first time in memory that another service has been proposed for

the two-meter amateur band. We must make sure it is also the last time. We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television -- the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that -- both at the meeting and iup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile- satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144- 148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! Here are the key addresses, including those of the mobile-satellite industry folks who seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554; choliday@fcc.gov; FAX (202) 418-0748.
Warren G. Richards, Chair, IWG-2A, Department of State, CIP 2529, Washington, DC 20520; richardswg@ms6820wpoa.us-state.gov; FAX (202) 647-7407.
Tracey Weisler, FCC Rep., IWG-2A, International Bureau, FCC, Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.
Mary Kay Williams, Final Analysis, Inc., 7500 Greenway Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.
Leslie Taylor, LTA, 6800 Carlynn Court, Bethesda, MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a lot of comments, including yours. But remember that the objective is to educate and persuade, not to intimidate. We don't need to. The facts are on our side.

To monitor the FCC's ongoing WRC-97 preparations, visit its WRC-97
home page at: http://www.fcc.gov/ib/wrc97/.

Are nicad battery terminals much different from regular alkaline battery terminals? To solder leads onto alkaline batteries I have had good luck with a small file.

First, file the area to be soldered so that it is shiny (oxides removed). Follow the first step with the second quickly, to prevent re-oxidation of the area. Second, heat the area with the soldering iron until solder will melt directly onto the contact rather than just the iron tip.

After applying a dab of solder to the area, you should be able to solder whatever you please to that spot. A higher powered soldering iron will make heating the contact go a bit faster, but it can be done with a cheapo 5watt iron. I hope this works as well for you as it has for me.

Good luck,

Jonathan Berry

There is really no great amount of danger spot welding tabs! They usually
are made of pure nickel material. I put two sharp pointed copper wires in
a soldering gun, place both on the tab in contact with the battery case
and pull the trigger for a short burst. The battery remains cool. W6HDO

Cecil, I'd love to know how exactly you did that (cap. value, wiring).
I am working on building an HF transmitter right now, and I have a
receiver; they share a 2.5m x 2.5m loop (square actually ;) mounted
vertically on my wall. I don't have a tuner right now, aside from a
knob on the receiver marked Antenna Tuning which is probably just a
variable cap also (but I find I spend most of my time with the knob
turned as far CW as it goes). Please post/e-mail/both. Thanks IA

Hello everybody.

I have bought a IC 706 and in my country I only can use it in 144 Mhz
with my licence. I need to modify it to only have full coverage onn 144 Mhz.

Do you know the mods to turn off the HF bands on this transceiver ???

Any comments are welcome. 73s

Hi all,
I'm looking for a chip or way to design a system that will generate a sine wave at a programmable frequency. My problem is that I want to cover 160m-10m at least, preferably all the way up to 2m or 70cm. I assume that such a wideband chip does not exist, so I'm looking for ideas on how to build a system to do this. Cost must be as low as possible, and that limits me to relatively simple stuff. Also, my knowledge of radio+electronics in general is sketchy, not to mention my extremely little knowledge of digital stuff. TIA for any response!

Source record: 104947

Quite a few things can affect the range. I have seen low power stations with high mountains around them get over the mountain with edge effect. KBAY is most likely ducting down the coast. The commercial FM propagation can share some characteristics with VHF marine propagation, and here on the Atlantic coast, ducting is quite common. Out there in california, ducting is responsible for contacts from CA to HI on the amateur band between 144 and 148 MHz. The presence or absence of stations on the same or adjacent channels will also have an effect. Since FM exhibits "capture", the station you hear need only be 1 dB stronger than the one you won't hear because of this effect. I'm sure the real technical types can add to this list.

Please excuse this brief intrusion, but we are trying to locate any and all holders of academic degrees conferred within the last ten (10) years.

The Kitty Knight Corporation, Boston, MA, is currently searching for qualified individuals to participate in a ***PAID*** study focusing on post-secondary, graduate, and professional education in the United States.

Holders of ALL types of degrees in ALL fields of study are needed. We would like to hear from you as long as your degree was earned at an accredited institution in the United States.

After an initial screening, qualified participant will be asked to complete a questionaire of approx 150 questions. Everyone who completes the survey will receive a $100 stipend. Naturally, *ALL* information will be held in the strictest confidence.

To express interest, please send your name, mailing address, and photocopies of **ALL** degrees you have earned to: The Kitty Knight Corporation, Attn: Study 96-3H, Back Bay Annex, P O Box 546, Boston, MA 02117. (If not obvious from the degree, please indicate the field of study.)

Thank You Very Much!

I had the pleasure of picking up two GE Porta-Mobil rigs, you know, the ones that look like a skinny lunch box with the handle on top. Anyway they both work and are on 44.720, anyone know what needs to be done to get these rigs on 52.525? I know how to get the freq I want and can certainly retune the cans but are there component changes required? I planned on just putting in some new rocks (as opposed to building up a synthisizer) and using them for Simplex.
Any input is welcome.

Tim ka8ddz

P.S bought them both for $3.00!

3527. High performance homebrew receivers

Message-ID: <31B2DD98.48E6@opgc.univ-bpclermont.fr>
Source record: 104952

Hi Rob

Enjoyed your message about high performance homebuild receiver.
I'm working on such a project since many months (years??).Here
are some comments and questions on the subject :

1.Preselector . What about insertion loss and selectivity of your
circuit (especially on the upper ham bands).
I merely build band pass filters centered on each ham band (present
status is 14 MHz only!!) so I'm interested in any ideas and comments
about good front end selectivity .

2. Front End . No comments .I'm using Makhinson ideas .

3. IF Filters and amplifiers . Your approach seems very smart but
what about Q degradation by the varactors and AGC stability problems
related to this structure .
Here I use home made ladder filters (12 poles for main and 4
poles for noise) I designed with the Hayward and Makhinson methods.
The band pass is around 2300Hz and shape factor in the order of 1.6
(6/80dB).I have also build a 1700Hz unit and designed a 400Hz one).
I agree with you that narrow filters build around common (and cheap)
crystals are associated with high insertion losses .
The present amplifiers are MC1350 chips but I recently ordered AD600
and AD603 in order to experiment the Carver and Analog Devices sche-
matics . I hope to improve the AGC behaviour through the use of the
"linear in dB" gain control characteristic .

4. Local oscillator . For the first tests I use a classical Colpits
VFO but I'm working on a DDS/PLL synthesizer (according to Rhode works).
The DDS build around an AD7008 controlled by a 80C552 microcontroller
is now operational:tuning is made by an HP optical coder and frequency
is displayed on an LCD panel .
The PLL part has to be build : I am interested in any comments or
advices you could made about the Rhode paper.

5. Product detector and Audio amp. The product detector is a classical
diode DBM . I made tests with the sample and hold technique proposed by
Rhode (QST Nov92) but the detector dynamic range improvement of this
circuit was not as high as expected . Any comments about this method
would be appreciated.
My audio amplifier is an ugly one and I suspect that great improvement
in A.F quality could be obtained !!!

This receiver forum is really fascinating !!!

>voltage across the coil is a complex issue that involves the
>actual operating parameters of the network. The phase difference
>across the input and output voltages is probably somewhere between
>90 and 180 degrees, and more likely at the 180 degree end.

I realize peak voltage may bear little resemblance to my
calculation of operating impedance. However, the method of
core selection that I described is based on overheating, not
saturation. Peak voltage shouldn't be a factor, only RMS.

Regarding phase shift, you're absolutely right. I considered
this beforehand, but made an error when I was thinking about the
effect. At 180 degrees phase shift, the actual voltage across
the two terminals would be the sum of the individual voltages,
not the difference. Therefore, relative to the example above,
the total voltage could be as high as 417 Vrms rather than the
275 Vrms I stated. I calculated flux density again using this
number, and it requires using the next larger core or a lower
permeability (the latter to allow increasing the number of
turns, which reduces flux density).

>You will also have an operating Q related problem. The current
>and voltage are no longer in phase, VAR power in the tank can be
>many times higher than the output power.

Once the pi network is resonated and tuned for a match to the
load, won't the power factor be unity at the plate of the tube,
as well as at the output of the network?

I can tell you how to work it out in terms of C/I. You can
then extrapolare to a new value of I3 for the complete system.
Often, one stage dominates.

Calculate the C/IP3 for each stage at the input level you
require. Then (making sure they are real numbers, not dB) add
together like you would for resistors in parallel.

i.e C/I= 1/(1/(C/I1) + 1/(C/I2) + ... 1/(C/In))

> I would also like to calculate the intermod product levels
> (IP3) for each stage.
>
You can't easily. You really need to measure it. As a rule of
thumb, possibly a bit pessimistic, add 10 dB to the 1dB gain compression
point for solid state PAs. For Valves it is different.

> When not stated, do manufacturer's IP3 figures usulay refer
> to input or output ?

Whatever gives the higher number!

Mike

3530. ? Triode Grid Current

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-03 00:00:00 UTC
From: guenter.koellner@oen.siemens.DE
Message-ID: <31B330EE@SmtpGate.Oen1.Oen.Siemens.De>
Source record: 104955

Hello all,

I finished a W6PO style amplifier for 144 MHz. It uses a russian GS35B tube. Most interesting is that I replaced the ceramic capacitors at the anode by a coaxial tube-in-tube construction at the anode resonator itself.

First test results are promising. At 6W drive and 2200V anode voltage I got 120W out and thats the expected 13dB gain. At 3500V anode voltage i got 6Win->180Wout and 20Win->500W out. I couldn't test more as i did not have more input power.

But there is a question that I want to ask here: The GS35B is rated 26W grid dissipation. But I can only measure grid current and grid voltage. How is the relationship? I can hardly believe that it is the standard P=U*I, because with 26W and 10V grid voltage that would result in 2.6A grid current.
Can anyone help me and clear my doubts? Additionally, what are the factors that influence the grid current at a triode most, is it coupling (thightener/looser), tuning (more or less tuning capacitance) or what else?

Thanks a lot for your help. If you need some details about my project, feel free to ask. If there are final results with higher anode voltage and higher drive I will keep you informed.

Has anyone used the Eimac 3CX5000A7 tube ? I want to know how to mount it and cool it. I have the data sheet, valve and chimney, but can't work it out.

It does not need any socket, so it is difficult to see how on earth it can be cooled if mounted on the grid flange as the data sheet says.

Any help appreciated.

Hi Jay,

I'd call Eimac an get a copy of "Care and Feeding of Power Grid Tubes" and
read it first.

There has been a lot of good information in Ham-type books, and a lot of
pure BS and wild fantasy stuff. Sorting out the mixture of information and
mis-information is difficult.

In general, the stuff in the OLD ARRL handbooks was very accurate, say
from the 1990 period BACK. Some of the later Handbook stuff has a bit of
mis-information and a few safety related errors.

In general, the Bill Orr amplifier stuff is good. The only error is in his
"super cathode driven" circuits. Avoid the super cathode driven stuff,
it's trouble.

Beware some of the tetrode stuff published lately, it seems geared more
towards selling tubes than giving solid design help. As a matter of fact,
I'd recommend avoiding tetrodes entirely unless you are very experienced
at designing and operating an amp.

The circuit described in RSGB Handbook and ARRL Handbook with a series tuned anode line (coil and small variable capacitor) works well for me and gives 300 W out with 500 W input. It is easy to build if you can find a suitable capacitor with 5 pF midrange.

If I build another one I'd copy the design of German "Dressler" PA which uses a quarter wave stripline. I've seen a photo in an advertisement and the mechanical layout is clever and compact.

Yes double sideband is used for amateur TV but only on the microwave
bands where there is room. FM is also used and is also wideband.

My TV transmitter on 1253 MHz is AM. In my case I built a cathode
modulated amplifier and followed that with another amplifier.

I have considered building a vestigial sideband filter but it
is a project that I haven't yet alocated time.

Hi!

I've been pla^H^H^Hworking with PIC microcontrollers lately, and they're a lot of fun... especially since their clock speeds go up as high as 33 MHz on some parts. You probably see where I'm going.

I wrote code on a 20 MHz part to flip a square wave at 625 kHz and modulate that at about 1.2 kHz (antenna < 3 m and power < 100 mW). So my project could broadcast its error codes in Morse onto a nearby AM radio. Fun stuff!

Actually, the square wave (50% duty cycle) generated such awful harmonics that it propagated farther (3 m instead of 0.5 m) in the FM band. <sigh>

Anyway, I'm wondering if anyone has used microcontrollers to do radio *directly* like this, and I'd be especially interested in whether anyone's done a *receiver* this way, maybe with a comparator wired as a differentiator for digital input? I know it's not "digital radio"... it's closer to an untuned spark-gap really.

I'm having a blast aliasing my 100 mW all over the spectrum and wondered if anyone else has tried anything like it.

Rick Miller
(Dang! I *knew* I should've taken that digital filters course...)

From: k1el@aol.com (K1EL)
Subject: AM Modulation Scheme ??

I have a military AM modulation transformer that I would like to use in a low power AM transmitter I am building (25 watts). The question is: The transformer has a single center tapped coil and is intended for push pull modulation. One leg of the coil has a much higher current rating than the other (70 ma vs 150ma) this is the end that would be connected to the plate of the final amplifier stage of the transmitter. Does anybody have any schematics for this type of modulation. I suppose it is similar to a Heising configuration except that the modulation drive is double-ended rather than single.

>matter. Just get an assortment of parts that are reasonably close.

I've ordered the 1% resistors as well as the C0G caps (NPO!!; Should have taken a closer look to the components chapter of the h'book before posting this question. (: < . Thanks for the previous poster reply in any case)

>If your varactor capacitance ranges are wide enough, you can make up
>for pretty much any other drift you might encounter.

Are you aware if NTE613 tuning diodes (~22pf at 4 V) could serve as direct replacement to BB809 or BB409 (~ 33pf at 2 V) suggested by the author. I have the MV2109 and MV2105 (thanks to my FANTASTIC contact) to be paralleled in replacement of any of the BBs, but would prefer 2 parts instead of 4 due to space constrains I have to deal with.

I'm pretty shure these parts are availlable in Montreal.

Again thanks to all,

H. Caron

That's much too high a ratio for a single transformer.
A circuit like this really needs a tuned tank for the
impedance transformation. Your concept of modifying a
6 Meter amplifier is probably workable, although at this
point, you might want to just replace the transformer
with the appropriate tank components.

From: Francis Lyn <lynf@candu.aecl.ca>
Subject: Help! 70MHz Amplifier???

Build your own PA stage. Motorola makes RF MOSFETS that will do the job,
and provide lots of application notes for high power broad band VHF

amplifiers using MOSFETS. With 30 W drive, a push-pull output stage is probably all you need.

The hard part in designing RF power amplifiers is to get the input and output impedance matching networks right. Since you want to drive a 5 k load, you should design the output matching network for a Zl = 5k instead of the usual 50 ohm. No reason to use a step up transformer, that is what the matching network is supposed to do (along with harmonic suppression, which may not matter in your application).

Call on some of your friend in Electrical Engineering; they should be glad to assist. Good Luck!

No. assume:

```
-------------R2---------
| |
10W R1 R3 5 W out.
| |
------------------------
```

Do this:
1) Find R1, R2 and R3 (R1=R3)

2) Calculate the voltage that gives 10W across 50 Ohm. This is V=sqrt(PR)=22.4V.
So there's 22.4V across R1, so R1 dissipates 22.4^2/R1
3) Do the same for R3, but it will have V=sqrt(5*50)=15.8V across it.
4) R2 dissipates 5-dissipation in R1 - dissipation in R3.

You might also check with some of the RC car types.

The racers think the tabs have to much resistance, so they always
solder up thier own packs using flat braid & matched cells.

Of course they abuse the cells (rapid charge & discharge) , so if life
in "normal" service were reduced by 50% they probably wouldn't notice
it.

Subject: homebrew GPS receiver ? on a balloon

GPS units also have a maximum altitude (so it cant be used in a missle).
I used to send up 5-6 ft. weather ballons for the forest service, and as I
recall, we got up to 20,000 ft in a half hour or so. So your commercial
GPS unit would be of no use after 30 min at most.
GPS's also have a maximum acceleration limit, if I'm not mistaken, but I
doubt if any balloon will ever reach that limit.
Good luck

I need to weld solder tabs onto a bunch of nicad batteries.
Thought I'd ask before I risk electrocution.

I don't have access to a proper welder, so I'd like to "make do".

I thought I'd jig up a couple of sharp pointed nails and press them against the strap up against the battery. I'll manually discharge a big cap into the nails. I have no idea how much pressure or how much energy will be required.

What's wrong with this picture? Anyone successfully welded tabs?
Details please.

On a related topic, I also have a bunch of nicads with tabs for push-on connectors. I need to save some space by soldering to the tabs. Of course, they won't solder (now I know why they were cheap), probably stainless. Is there a flux for soldering stainless?

Thanks, miker

I used to work for a company in Beaverton called Micropower. They made battery packs for all kinds of stuff. We would use spot welders with nickle strips for connecting the terminals. Superglue and accellerator was used to glue the cells together. Sometimes shrink-wrap was put around each cell before gluing.
Superglue bonds well to shrink wrap.

If the batteries had copper surfaces (or if you can sand off the plating and get copper), you could try using one of those chemical tin plate kits that they use for plating pc boards. Make sure the battery is discharged.

However, I believe that these batteries have nickel plating. Because nickel is more electropositive than tin the plating kits probably wont work. I believe that they work on the principal that copper is much more electronegative than tin. Uck- I hated this part of college chemistry.

There are also some very low temperature solders. Maybe the solder paste used for surface mount devices would work.

Hi Jack, Add stub matching to that pot. The theory of stub matching
has been forgotten. Stubs need not be pieces of transmission line.
Functionally, they can be a capacitor or an inductor. I use stub
matching theory and one single variable capacitor across the
ladder-line at the operating position to achieve a 50 ohm SWR
of 1:1 on *all* HF frequencies with a 102 ft. dipole. It is
the easiest, most efficient antenna matching technique that
I know of. Why in the world has it been discarded? It works
as well and usually better than an antenna tuner and costs a
lot less.

Subject: Physics of FM

Hello everything.

(knowledge of the geography or mileage of northern and/or southern
California will be helpful in answering this post. Sorry I don't have better
numbers)

I don't know if this is a reasonable place to post this or not. But because
I can't think of where else to post, I'll give this a shot.

This post is inspired by the contrast between my various observations
and my father's theories. Also my various observations contrast with each
other a little.

Can anyone tell me what the facts are about how far FM radio can reach
in the United States? There must be federal regulations on the power of
the stations and physical limitations due to either the curvature of the earth

or just the distance which would make it impossible for a signal to
stretch beyond a given distance. I am in San Diego and am able to
pick up a Los Angeles station (K-Earth) load and clear, although it may
break up every now and then. If you live in this area or are familiar
with Southern California, you know what distnace that is. (Half way Oceanside
to TJ, I'm in LaJolla). I don't know, I guess it's between 100 and 150 miles
from here to LA

There's another station (91x) whose broadcast tower is on the hills of Tijuana
and supposedly doesn't abide by the FCC rules because it's in Mexico..
So it has a super-strong signal, and my brother said that he was actually able
to hear them once or twice in Santa Barbara (250 miles?).
My father says that's doubeful due to physical limitations.

There's a third station (102.1) which is located in Oceanside, border between
San Diego and Orange counties. That's probably only 100 miles from L.A.
Maybe less, depending on how you count Los Angeles. Would you expect
to be able to hear that station well into LA?
I have no problem (or little problem) getting them here in LaJolla
(30 miles?) but in Hillcrest (another 15 -- 45 or 50 miles?) the signal
started to break up.

Finally, there's one more station (100.3 I think) which is KBAY I think
in the San Francisco bay area, which I have been able to hear all the way
down 101 to Gilroy or even due East of Monterey.
I am not sure how far this is -- maybe 130-150 miles?

My father has assured me that there MUST be a repeated somewhere in
order for that signal to reach so far.

So what's the deal? Is there a magic number of miles (1) that an
average-to-strong signal (2) can travel and be picked up by a reasonably
good receiver? (3)
What about a station which doesn't pay attention to FCC limits? (4)

Please let me know if this should be re-posted elsewhere or if I should
look in a reference at a library.

Thanks

-Allan
allan@carhart.com

(1) assuming average weather conditions --probably more sunny days than cloudy
ones in North and South California
(2) assuming the radio station is within the FCC limits but at the high end
(3) boom box with analog tuner and/or high-end walkman with digital tuner
and/or car radio with digital tuner
(4) I would assume that 91x (91.1) doesn't exceed federal limitations
by too much due to either financial limitations or Mexicon Government limits.

Another method is to measure the distortion products as the signal
is increased and note the point at which they begin to rise.

Yes and in addition, use a scope to monitor the voltage. ANY distortion
whatever of the signal is a clue to saturation! CliffButtschardt

Date: Fri, 31 May 1996 18:48:45 GMT
From: dgf@netcom.com (David Feldman)
Subject: Sizing toroid core for use in tube pi-net?

Is there any sort of rule-of-thumb on choosing the correct core size for a toroid core tube used as substitue for air core coil in a tube-output HF final/amplifier section? For example, at 7 MHz, 700 volts/300 mA (maybe 100W output...) would a T200-2 core be required, or could a smaller one be used, or would the T200-2 even be sufficient? If you wanted to make a multi-band output network (with tapped coil), would you need to size the core for the highest operating frequency (assuming similar tube operating point for each frequency)?

Any advice appreciated,

73 Dave WB0GAZ dgf@netcom.com

Since you only want 360 degrees of phase shift over a narrow bandwidth, this should be pretty easy. You could build a four-pole (actually four pole pairs) bandpass filter and make it a "maximally linear phase" (equivalently "maximally flat delay") type. This should do the trick for you. You can also do a lumped-LC delay line, which is essentially a low-pass filter; the bandwidth would be much greater, but you don't indicate you need that much bandwidth. If you would like to try the maximally flat delay filter and don't have design info, I'm sure someone here could post a design.

Yes, amateur AM-ATV is typically double sideband. This has been
kind of a sore point for ATV on the lower UHF bands since most
ATV'ers don't use VSB filters.

Why would you want to do this? If I understand things correctly, tubes are much more robust (especially at being overdriven, handling mismatched antennae, EMP from lightning, etc). By comparison, semiconductors are quite fragile.

I would guess the disadvantages of tubes is that they run hot and availability can be a problem. However, the Russians currently make a number of good output tubes (equivalent to many Western types). Is yours among those they make?

Genuinely curious,

Chris.

Some years ago I had need for various delays and found quite a variety of commercial distributed LC units available. You might check a distributor's catalog. Intended for digital use, the tradeoffs were size/delay/risetime, so smaller ones would result in more attenuation at a fixed frequency. If you want to try a lumped LC line, the best treatment of the topic I've seen is in Millman & Taub, "Pulse, Digital, and Switching Waveforms", Appendix C.

Hello Matt,

When I was a Biophysicist, building the 3rd FFT NMR spectrometer,
I needed several hundred watts pulsed 60 MHz.
I found a used 6 meter 500 watt linear and modified it.
I would recommend the same to you.

That would give you safety margin for duty cycle and derating with
increased frequency.

I don't see why you don't just resonate the pockel cell capacitance
with a air coil that you then feed with a tap or link coil fed with
50 ohm coax with type N connectors, standard measurement impedance,
matching impedance etc.
You could buy a 6 meter transmatch and insert that into your 50 ohm line.
That way you separate your amplifier project from
your pockel cell tank circuit project.

Hi Dave,

I've build several amplifiers using that tube. First, the 3CX5000 is a bit cathode emission starved. It makes a great 5000 to 7000 watt out amp, but quickly runs out of steam.

I much prefer the 3CPX5000A7, even for linear SSB and CW service.

I make a plate that matches the grid flange pattern, and machine wide slots in the plate outside the area of the grid flange with a 1/2 inch milling bit. This allows air to pass, and the grid flange to be grounded. It looks a bit like a slotted car wheel when done. The 4CX5000 chimney fits fine.

With a 3CPX5000A7 at 7800 volts anode tension, the 3CPX delivers over 10000 watts with 200 wattts of drive. In short duty service I have run up to 25,000 watts out with excellent linearity, but the drive requirement is over 1000 watts.

Treatment of the filament, to avoid hum, reqires a bit of attention. It's that darn cathode connection that is a problem. The tube is VERY stable, and requires NO parasitic suppression if the layout is at all reasonable.

Jay, see if you can obtain a copy of "Radio Handbook" edited by Bill Orr. In
the17th edition for example, are complete plans for building the "Utility" 2
kW amp, using 4-100A or 3-1000Z or 3-400Z or 4-400A or 813 or 4CX250B or
4CX300A or 811 tube(s), with details for whatever tube(s) you choose. In any
event, find a copy of any edition of this handbook, they all have excellent
details for HF and VHF power amplifiers (I suspect Bill's special subject,
next to antennas).

Another goodie is "Care and Feeding of Power Grid Tubes" published by Eimac.

73, Drew, VK3XU.

We're talking FM video here. Although there is some AM component,
actually more than a bit, we're interested in the FM modulation here at
2.4 GHz.

Hi Guenter,

The grid dissipation primarily relates to the average RMS grid to cathode voltage and the average RMS grid current.

There is a secondary effect caused by dielectric heating and some other lower order effects that you can usually neglect in the type of service you are using.

You only need to read the grid current from the meter and multiply it by the average RMS grid to cathode RF voltage while the grid is conducting to get a reasonable dissipation approximation. You can estimate this from the constant current charateristic curves of the tube if you have them.

Nick Button (nick@plains.demon.co.uk) wrote:
: Does anybody know of any circuits for add-on synchronous detectors for
: AM broadcast reception ?

A synchronous detector is basically a switch that is synchronized with a carrier. The signal to be detected is fed into the switch which is turned on during carrier peaks, and off at other times. The trick is to avoid false triggering caused by noise. Therefore, a PLL is used to regenerate a pure carrier from the original and thus remove the noise. This pure carrier is used to drive the switch. The switch can be a double balanced mixer, or even something like a CMOS 4066.

The main engineering issue is to account for the phase offset from the output of the PLL. Many PLL designs will synch with a carrier but with a constant phase shift, typically 90 degrees. The trick is to subtract the phase shift before driving the switch.

The cost to build a synchronous detector should be less than 5 dollars.

3562. Cooling of power tubes - theoretical/practical problem.

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-04 00:00:00 UTC
From: davek@medphys.ucl.ac.uk
Message-ID: <1996Jun4.112117.35717@ucl.ac.uk>
Source record: 104890

Does anyone claim to understand the requirements for cooling air flow of
power tubes ? In particular, how does one calculate the volume flow
rate required with inlet air temperatures above those on the data sheet ?

Assume a valve requires X cfm at 25 deg C inlet air. How much does it
require at 35 deg C or 50 deg C inlet air temp? According to publications from both
Eimac (Care and feeding of power grid tubes) and Burle (application note
on cooling, cant recall exact reference), it is increased by a factor
that accounts for the lower density of air as its temp is increased.
So to keep the same *mass* of air, the flow rate must be increased.

However, when one finds a data from Eimac on one of their tubes for
higher inlet air temps, it never seems to fit the fiddle factors
they state. The flow rates required at high input temps seem much
higher than the factors given would have you belive.

At first I found this odd, but after thinking about it, it became
obvious that two effects both require more air, so considering only
the density loss is not sufficient. These effects are:

1) The loss of density, given by a factor:

F1=(273+T)/(273+25) where T = inlet temp in deg C.

AND

2) The fact that as the inlet air is hotter, the difference in temp
between the air and the valve is less, so less heat is transfered.

I assumed the air flow would scale by another factor:

F2=(273+250-T)/(273+250-25),

where T=250 is the max tube temp. However, if the air flow requirements
at 25 deg C are scaled by a factor F1*F2, it still does not fit the data given
on data sheets.

If you are followed this and have an ideas, please let me know.

3566. WANTED: Panel Meter for Heath SWR Meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-04 00:00:00 UTC
From: mvi@ix.netcom.com
Message-ID: <4p1f7u$icf@dfw-ixnews6.ix.netcom.com>
Source record: 104894

An on-air acquantance has a Heathkit HM-2102 SWR meter with a sticky meter movement. He has asked me to post a request to possibly locate a source for a replacement panel meter.

As an alternative, he would like to hear from anyone that may have a manual for the HM-2102 and could provide the value for the meter so that he may be able to replace it with an aftermarket part. Of course, he would prefer a Heath replacement.

Any help that you can provide will be appreciated,

73,

John, KB2YJH

>Cecil, I'd love to know how exactly you did that (cap. value, wiring).

Hi Isaac, The thing that makes it all possible is a Ladder-Line Length Selector (no, I don't sell them). Using digital techniques, it is possible to use 'N' relays to obtain 2^N variable feedline lengths in increments of 'N'. I've found one foot increments to be about right. So with 5 relays, one can get 0-31 ft in increments of one foot. Varying the length of the ladder-line is the most effective matching technique I know. Using that technique, you can bring the current maximum point to the capacitor which will result in a purely resistive impedance of 50 ohms, 75 ohms, 200 ohms, 300 ohms, or 450 ohms (take your choice) all within 0.1 WL of the current maximum. You can use *any* balun you have available. You can find the current maximum with a $15 Ladder-Lizard from TechnoLogic Concepts.

I can't post my whole application note here. It is available from TechnoLogic Concepts, TLCdhconsult@delphi.com I don't get a penny from the publishing, I just want to spread the word.

Note the implications: Ladder-line is less lossy and less expensive than coax. Using ladder-line allows for a low-loss all-band HF antenna except for the balun/tuner problem.

But it is easy and advisable to achieve a match on the ladder-line side of the balun. It can be done with a single variable capacitor. You don't need a commercial antenna tuner at all!

If I were an HF antenna tuner manufacturer, I would start designing a Z0-matched relay switching network cuz that's all that is needed besides a $10 variable capacitor to beat the socks off the presently commercially available configurations.

W7ZOI and W1FB give the following rule of thumb for bipolar transistor amplifiers in "Solid State Design":

IP3 = 20 log (Ic in mA)

They mention this an approximation, so don't go too crazy using this for designing. Consider it optimistic and you'll probably come out ok. They also mention that the 1 dB compression point will come out around 15 dB below the predicted IP3, similar to the above.

Tom, do you mean in the middle of the inductor? If so, I
don't see how this affects the applicability of the Amidon
flux density formula. Phase shift between voltage and current
will occur within the inductor no matter how it's used.

>We're talking FM video here. Although there is some AM component,
>actually more than a bit, we're interested in the FM modulation
>here at 2.4 GHz.

This thread has raised two issues that I don't understand.

First, AM modulated NTSC (VSB) video is most easily generated through the use of a low-level IF output modulator. Such a modulator usually contains a visual SAW filter at 45.75 MHz that is responsible for comverting the DSB visual signal to VSB. Why aren't hams using this approach? It would certainly be less expensive to build a VSB IF modulator than to use a pair of 4CX250B's in a high-level modulator at the final. It's also a more efficient use of power and spectrum.

Second, why are hams using FM video? Aside from the huge amount of bandwidth it requires, it's the mode that's least compatible with commonly-available reception equipment, including NTSC TV receivers.

On a related topic, do most ATV transmitters upconvert and amplify the signal in a combined visual/aural format? Haven't hams made the switch to separate upconversion/amplifier chains for the visual and aural carriers? This technique greatly reduces intermod and allows much greater visual carrier output than combined amplification.

_____________________________________________

1.0 What is BASIC Stamp ?
-------------------------

This is being written for people who have no idea of what a BASIC
Stamp is...

BASIC Stamps are small reprogrammable single board computers (SBC)
that run BASIC programs and are made by Parallax, Inc. in US. At
first glance, they may seem fairly minimal - and in fact, they are.
But with software that fully utilizes all available hardware, the
Stamps give you powerful features - without the cost of hardware.

Their low cost and simplicity make the Stamps perfect for many
prototyping and control applications. It's suitable for electronics
hobbyists as well as electronics professionals in many different
areas.

Typical application areas for BASIC Stamp's are...

- General electronics
- Home automation
- Robotics
- Mini PLC
- Education
- Prototyping
- HAM related applications
- Special effects in films
- Industri control
```

- Geological instruments
- Computer peripherals
- Scale model hobbyists
- Model train hobbyists

As an talent engineer and technical writer expressed it...

- BASIC Stamp is the 555 of the 90's !

1.1 What is L.O.S.A all about ?

I started to compile L.O.S.A because I know there are lots of great ideas and many problems that are solved with the BASIC Stamp and the main purpose of this list is to get an idea of what other people are using their BASIC Stamps for and maybe get some inspiration or hints.

Remember it's up to all of us if this list are going to be any good and I'm looking forward to receive a description of your application.

1.2 How can I contribute to this list ?

If you have done something with the BASIC Stamp (big or small) that you are willing to tell others please use the form given below and write a short description, nothing fancy is needed just a simple explanation. If you have source code to share that's even better but it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in the L.O.S.A form on the Web-page...

Title : Robo-Cat [# 001]

==========

Date : 950807
Author: Gustavson Guy W.
E-mail: GWGUSTAVSO@mpg.norstan.com

Stamp model : BASIC Stamp Rev. D
Code available: N/A
Filename : N/A
URL : http://www.winternet.com/~bigfoot/cat.html

Description :

My cat, Kesha, was recently diagnosed with Heptic Lipodosis. Or "Fatty Liver", basicly what this means is that for some reason he stoped eating and his liver started converting body to useable sugars. The fat deposists biuld up in the liver and cause severe liver damage. Because the liver isn't working well the cat feels crappy and wants to eat even less. The treatment for this disease is to run a tube down down the cats nose into his stomach, or a PEG tube through the abomine wall into the stomach and feed the cat a liquid diet this way.

I love my cat, but I can't be there every three hours to feed him through the tube for a month. Something about work and deadlines and such. So I went to a local supplus house and got a tiny motor driven pump, a case, some switches, a micro switch, ect...

The micro switch is mounted such that the switch trips for every rotation of the pump shaft. The stamp turns on the pump for on a single rotation at intervels programable from the controll switches on top. An alarm buzzer and LED flash if the pump fails to run for any reason. The unit is programable for 9 differents deleviery rates.

Now he gets a slow continuious feeding and he seems to tolerate this better than the 100ml feeding every three hours.

==========
Title : Logic Rudder [# 002]
==========
Date : 950812
Author: Christer Johansson
E-mail: cj@hth.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : LRUDDER.ZIP
URL : http://www.hth.com/filelibrary/BS1-IC/

Description :

Many of the new and very realistic flight sims available today needs rudder to let you get full control. This one uses a digital pot from Xicor (X9104) and 10 other components. Connects to a standard IBM-PC game port and power is taken from the port.

It uses two micro switches for controlling the rudders left or right and to indicate when rudders move there is a red LED that lights up when you press the micro switches and to indicate center there is a green LED. If you press the both micro swithes the rudder will automaticly return to center position.

There is a trim pot to set the desired step rate from slow to very fast and the Xicor pot has 99 steps wich gives a fair resolution.

Author: Helmut Fligge
E-mail: h.fligge@asco.nev.sub.de

Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : N/A

Description :

This Program interfaces the Stamp1 to the MAX186 A/D converter. Via RS232 2400bps the stamp is asked to measure channel numbern. After conversion the result will be returned to the host computer as an ascii string (0 .. 4096). Conversion rate is about 4 measures per second.

==========
Title : Scrolling LED Sign [# 004]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Maybe sometime
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Scrolling LED sign, 35 super-bright LEDs in a 5-by-7 matrix in the prototyping area of a Basic Stamp rev D. A scrolling alphanumeric message moves one pixel at a time, just like real scrolling LED signs, except this one only displays one full letter or portion of two letters at a time as the message moves by.

==========
Title : Tone Decoder [# 005]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Soon
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Listens for telephone touchtones, displays phone numbers on LCD screen and echos them out RS-232 port. Circuitry fits in prototyping area of rev D Basic Stamp:

Microphone preamplifier, touchtone decoder IC.

==========
Title : Pager [# 006]
==========

Date : 950928
Author: Don McKenzie
E-mail: donmck@labyrinth.net.au

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : PAGER.BAS
URL : http://www.labyrinth.net.au/~donmck

Description :

This program for the Basic Stamp is used to monitor 4 hardware signals. If a change takes place, (after testing for a false trigger) then a cheap 2400 baud MODEM is used to dial into a Telecom Alpha-Numeric pager. It leaves a message which consists of a 2 digit I.D. (01 to 99) followed by the 4 signal levels of pins 3 to 0.

Status of the signal levels message: 0=Low, 1=High. EG: "011110" means Unit "01" has pins 3, 2, and 1 high, and pin 0 is low.

A "Ring-In" feature is also included. By ringing the MODEM for a short period, then hanging up, the Stamp will dial your Pager and report the current hardware status of these four signals.

This program uses about half of the available memory, so if the user wishes to add enchancements such as "Multiple Ring-In's" say within a minute, for a command selection, there is plenty of program space left.

==========
Title : HexWalker Mobile Robot [# 007]
==========
Date : 960511
Author: Tom Thornton
E-mail: mandtsys@ix.netcom.com

Stamp model : BASIC Stamp Rev. D or BS1-IC
Code available: YES
Filename : WALK.BAS
URL : N/A

Description :

HexWalker is a hexapod robot that exhibits obstacle avoidance behavior. It is controlled by BASIC Stamp, BS1-IC, or Stamp chipset (PIC16C65 + EEPROM). Driven by three servos it is the simplest machine architecture that can walk forward and backward, and turn left or right. A kit is commercially available contact author for details.

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : EXPBOT.BAS
URL : E-mail author and he will send it
--------------------------------------------------------------------------
Description :

This program allows a cool robot to move abound a room in search of
light. Like a moth. Simple program changes can dramatically change
the robots behavior.

==========================================================================
Title : Andrews Ever Evolving Lego Robot [# 010]
==========================================================================
Date : 951119
Author: Andrew H. Hochheimer
E-mail: softarts@ciaccess.com
--------------------------------------------------------------------------
Stamp model : BS2-IC
Code available: YES
Filename : N/A
URL : http://www.wincom.net/~softarts
--------------------------------------------------------------------------
Description :

Currently the robot can only navigate to the brightest light source
in a room. It's current operation mode has four major steps: - Scan
a 180 Degree Field of "Vision" taking light level readings, and
determining the brightest direction of light. - Decide if it needs
to turn left, right, or continue moving forward. - Check for colli-
```

sion with an object while moving, if a collision occurs, display the total travel distance on the display - Move forward for 1.5 Seconds and then repeat the process.

Currently I am using Two Futaba FP-S128 Servos (any RC Car Servos would work) one to sweep it's "sensors" form left to right, and one to "stear" the robot.

You can see pictures and more information on my homepage, just follow the lego robot link.

```

Title : Factory Monitoring System [# 011]
================================================================
Date : 951120
Author: Paul Willemse
E-mail: pjwill@merlion.singnet.com.sg
----------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author
----------------------------------------------------------------
Description :
```

The system presently consists of 4 Basic Stamp units. Each monitors up to 5 inputs. The inputs are 'digital' (switches) and/or analog (temp, airflow, current, etc using commercial sensors). All stamps communicate the results via serial mode to a Macintosh (Yes a Mac!) where the results are graphically displayed and monitored. Alarms are set for certain conditions.

The transmission is simple, one way only. Each stamp sends the info at a 'random' interval not exceeding 2 seconds. The message format is fixed, the Mac will throw away any conflicts in case two or more stamps transmit at the same time. BTW this happens very seldom. The max time any stamp can be 'absent' from the chain before an alarm is raised is six seconds (failure, transmission collisons, etc). This is controlled by the Mac.

The 'system' is presently in beta test, the client wishes to expand up to 20 stamps. At that point we will likely use the BS1-IC or BS2-IC on custom boards located around the facility.

Code is available upon request (e-mail) partial, some is proprietory to my client.

```
================================================================
Title : Wave to the Cats/Desk Temperature [# 012]
================================================================
Date : 951121
Author: Paul Haas
E-mail: paulh@hamjudo.com
```

Stamp model : BS1-IC
Code available: Yes
Filename : See web server
URL : http://hogwild.hamjudo.com/cgi-bin/stamp

Description :

The Stamp has a serial connection to web server, a cardboard hand, a servo motor to move the hand, and a DS1620 thermostat chip to measure the temperature. The web server can request the current temperature or start the hand waving. See the web page for the source code for the temp and the web server.

It's mostly useless. The cats ignore the hand. A few people find it entertaining.

==========
Title : Gamer's Die Roller [# 013]
==========
Date : 951122
Author: Larry Tremblay
E-mail: ltremblay@domus.com

Stamp model : BS2-IC
Code available: N/A
Filename : N/A
URL : N/A

Description :

The Gamer's Die roller is a little thing I am putting together as my first Stamp Project. The Roller allows cumulative rolls of n dice up to 256 sides, so long as the sum does not exceed 99,999,999(!)

It uses two 74HC161 4 bit counters cycling at 1MHz to draw random numbers off of. Input is achieved via a Grayhill model 38 keypad and a 74C922 keypad decoder. Display is on a Siemens PDSP-2111 8 character smart display (5x7 LED characters) fed by two 74HC164 serial to parallel shift registers cascaded so I can use Shiftout to feed 16 bits of control + data off of 2 pins.

The code is very simple, the most exotic part being the random number generation. In a nutshell, it is:

Begin Loop
S = 8 bit number drawn from the counter (random)
if S < (255/N) x N (integer divide, N is number of sides on die)
exit Loop
End Loop

This gets (pseudo) random numbers whose average is not skewed downwards by the counter's max of 256 (i.e. a 100 sided die is not

affected by the extra 56 in the count maximum)

Using gamer's dice notation, (5d6 = sum of 5 six sided dice, 3d10 = sum of 3 ten sided dice), the user can input whatever combination they wish, including just 'd6' for one six sider. The keypad I have has removeable keycaps with legends, so I have 0-9 plus 'd' and '=' on them.

As noted earlier, since I am using an 8 bit counter, the maximum die size is 256, although that could be fixed easily by sampling two, three or more times for each die.

Anyhow, that's it. When the code is done and debugged, I'll be happy to e-mail it to any who want it.

Title : Sculpture control [# 025]
=============================================================================
Date : 960323
Author: Pierre Olivier
E-mail: olipie@aei.ca
-----------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: N/A
```

Filename : N/A
URL : N/A

Description :

I have been working with sculptors for some time doing control circuits for their works using 555 (limited), industrial controllers (expensive and hell to program) and lately Basic Stamp.

Our latest piece deals with image deconstruction: it consists of 20 vertical cylinders on which an image is wrapped. Each has a photo detector to detect "position zero", and a custom basic stamp board with a MC3479 step motor driver that drives a step motor which turns one cylinder. Each cylinder can thus have its own routine which positions it precisely (400 steps/rev motors) where we want it for any amount of time, at any speed (very interesting sonically at sub-second stepping speeds!).

The stamp outputs direction, step and enable signals to the motor driver and a ready signal to a common line. It receives signals from the aforementionned ready line, and from the optical sensor.

It would have been quite a bit more complicated, bulkyer and expensive to implement this project without the stamp.

==========
Title : Commercial clothes dryer controler [# 026]

Date : 960401
Author: J Amy
E-mail: Kuznjack@aol.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : N/A

Description :

Detects drop of coin and increments time remaining register. Actuates main and heat relays. Checks temperature, and controles heat relay Periodically decriments time remaining register. Provides cool down cycle in last four minits.

Replaces original controler which costs several hundred dollars, and is not reliable.

==========
Title : Morse Code Keyer [# 027]
==========
Date : 960415
Author: Richard Clemens
E-mail: clemens@academ.wvwc.edu

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : http://www.ccue.org/stamps/morse2_bs2.html

Description :

This program provides a four message keyer for Amateur Radio. The user can input four different messages, their character counts, and use four buttons to display the output and/or key a transmitter.

NB: the messages are limited to the upper and lower case letters, digits 0-9, space, period, comma, ? and /

Program is based on the information in Stamp I - Note 8 and uses some code from that note.

==========
Title : Traffic Light Controller [# 028]
==========
Date : 960418
Author: M-Systems Inc.
E-mail: mstems@aol.com

Stamp model : BS1-IC Module
Code available: N/A
Filename : N/A
URL : N/A

Description :

We have used a BS1-IC to control a simple two way intersection coordinate the timing and switching of a traffic light at a two way traffic intersection.

==========
Title : Automotive Lamp Control [# 029]
==========
Date : 960427
Author: Ron Woodward
E-mail: RWoodward@gnn.com

Stamp model : BS2-IC Module
Code available: N/A (Will share concepts)
Filename : N/A
URL : N/A

Description :

This system involved connecting two BS2 units to a bank of 28 MOSFET drivers which controled the external lighting in a demonstration

vehicle shown at the SAE expo in Detroit MI.

The lighting control had to perform PWM modulation simultaniously on 10 different circuits while controling Turn, Stop, Tail, Backup Hi Beam, Low Beam and fog lamp circuits with a set of preprogrammed timing sequences.

The timing was worked out so that the PWM of the lamps was flicker free throughtout the demonstration sequence.

The BS2 units worked together in a master - slave relationship to maintain proper sequencing of lights on both hands of the vehicle.

==========
Title : Single Switch Scanning Device for Disabled [# 030]
==========
Date : 960508
Author: Chuck Benson
E-mail: Chuck%6567006@mcimail.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author

Description :

This project modifies a Lanier VoiceWriter dictation device so that it can be operated by a person with a severe disability such as quadriplegia.

The interface to the device is via the VoiceWriter's hand contro-ller. The connections to the external switches are removed and replaced with switch closures via reed relays driven directly by the PIC's (BASIC Stamp's) I/O.

The user starts operation of the device by operating a SPST switch (typically with his or her cheek or jaw). The user then hears a series of five (5) tones which come from a piezo-electric speaker driven directly from an I/O pin.

The tones correspond to 'Play', 'Stop', 'Record', 'Rewind','Fast Forward'. When the desired tone is heard, the user activates the switch again and a relay corresponding to that function is closed. This in turn provides the desired function from the dictation device.

The code is a series of nested loops that provide the tone & the relay selection. Copies of code are available upon e-mail request.

==========
Title : Bell timer for school bell control [# 031]
==========

Date : 960511
Author: David Abineri
E-mail: dabineri@tso.cin.ix.net

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : E-mail author

Description :

This is a sytem which allows flexible control of bell schedules for schools. One may program up to seven different schedules of 30 different times each. Data entry is with a small keypad. Indicators show the schedule currently being used and the day of the week.

Users may instantly select which schedule to follow and may even enter a special schedule in a matter of a minute or so. The system simply operates a relay that rings all the bells in the building. Editing schedules is allowed as well as manual operation.

==========
Title : RIMS controller for beer making [# 032]
==========
Date : 960511
Author: C.D. Pritchard
E-mail: cdp@chattanooga.net

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : E-mail author

Description :

Controls mash temperature on a recirculation infusion mash system (RIMS) and also controls the sparge water tank temperature. Uses thermistors to monitor temps- 2 on the RIMS and 1 in sparge water tank.

Controls AC power supply to two 1500W heaters via optoisolators/ zero-crossing driven triacs. Setpoints are entered via 4 keys. Elapsed times, temperatures, setpoints and heater statuses are displayed on a 2x16 LCD. Sends data via RS232 to a PC for logging and analysis.

>
>73,
>Jack WB3U

No, in the middle of the resonant network. The inductor is part of a resonant circuit, just as a balun is when feeding a reactive load. This increases the heating and fux density in direct proportion to the system's operating Q.

In a given system, an operating Q of ten (when the inductor is part of the reasonat system) increases losses and heat by the same amount over a system with a Q of unity. That applies to baluns as well as tanks. System Q is important.

3574. PCB Manufactures in UK

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-04 00:00:00 UTC
From: Matthew Bailey <matt@kascade.demon.co.uk>
Message-ID: <708624708wnr@kascade.demon.co.uk>
Source record: 104902

I am looking for a company in the UK to make a PCB for me. In the past I've made my own PCB's but my designs are becoming more and more complicated and I do not have the proper facilities at home. I would be grateful if anyone could send me any details or recommend any companies that I might be able to use. The PCB will be a 2 layer design with through platted holes and a silk screen.

I realise this is probably not the correct news group to ask this question, but after a number of searches on the news groups I thought this might be the most appropriate. I spent an hour searching the WWW this morning and found a number of PCB Manufactures in America but nothing in the UK.

Jay Radcliffe <n8rhv19@mail.alliance.net> wrote:
>.... What is either a good
>book to read to help me understand how to build one and/or a good project already designed to help
>me accomplish this task.

Been in this mode myself . Here is my take:

Plan on a grounded grid design. This is by far the easiest to stabilize, and does have some effiency advantages.

Don't even consider trying to run a triode in common cathode mode...It's just begging to oscillate.

ARRL handbook has several designs, w/construction articles, and a design example. These vary from year to year, so you should seek out some older handbooks, and get a feel for the variety of designs.

2x 3-500Z or 1x 8877 are "normal" tubes for amateurs to use. Other tubes will work too. The handbook has a table of parameters in the back. You can connect "extra" grids of pentode and tetrode's to control grid and "make" a triode if you find a good deal on them.

Some of the Russian tubes look pretty good. It may be worth designing around these. When selecting any tube, be sure to consider cost of sockets and other unique hardware it requires. Also mind the drive requirement under grounded grid service...you need fairly high gain to get 1500W output at only 100W input. If you find a good deal on a non-standard tube, I'bd bite the bullet and buy spares up front. No telling when russia might collapse, taking your source of spares with it. The prices can be good enogh to make this a viable option.

Typical leagal limit amp willl need ~3500 V at nearly an amp. Running lower voltage can cause problems achieving adiquate drive without excessive grid current., Still, I have seen designs running as low as 1500V. Depends on your tube. Figure ~2500W will be required from plate supply, less voltage needs more current, more filter cap.

Start accumulating bits at swap meets. Make a list of required components etc.

If you can find a really hot deal on any of the following critical items, snap it up and design the rest of the amp around it:

-Vacuum variable plate tuning cap.

-New tube(s) ..beware of used tubes. If you find great deal, it is probably used....but if replacement would be reasonable, it

-Sockets and/or chimmneys.

-Plate transformer.

When you have 2-3 of these items, it is time to "get serious", about finding things to finish the job. put some WTB messages on the swap nets etc.

Work your way into an 80M net. Lowbanders NEED amps, and many 80M types tend to accumulate/hoard key items.

Also keep your eyes peeled for blower, HV filter caps, HV bandswitches, Large cabinets, vacuum relays, plate choke, meters, knobs.and the like. These sorts of things add up to hundreds of dollars if bought new, so there is still a lot of room for scrounging/saving, even if you end up paying full boat for the "big ticket" items.

Good luck, and only use that sucker when you need it!

-KF-

>attenuation experiments. If you can help please let me know.
>

Consider a digital puesdo random noise generator. It's typically implemented as a shift register
with feedback arranged to generate a sequence which when low pass filtered has a constant power
per bandwidth (white) characteristic. The clock rate determines the maximum frequency before the
spectrum begins to droop (sin(x)/x) and typically is at least five times the maximum desired
frequency. The sequence length should be long enough so the noise appears uncorrelated for your
purposes. A 12 bit shift register gives a sequence length of 4095 cycles and is probably enough
if you clock it at 500 Hz or so. You can greatly reduce the demand on the low pass filter by
using several bits from the sequence to drive a D-A converter giving more voltage levels on the
generator output.

I think the book "The Art of Electronics" by Horowitz and Hill has exactly what you're looking for.

3578. NBVM - what is it please?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-04 00:00:00 UTC
From: word.factory@zetnet.co.uk
Message-ID: <4p1vlr$6h0@roch.zetnet.co.uk>
Source record: 104906

Grolier's Multimedia Encyclpedia release 6 has this entry under 'ham radio':

"Amateur, or 'ham,' radio, a noncommercial system of communication, is as old as the medium of RADIO itself. The origin of the term ham radio is unknown. Many important communications discoveries have been made by hams. Amateurs, for example, perfected the single sideband (SSB) mode, now widely used by the military, after World War II; in the late 1970s, three hams developed the revolutionary new system of narrow-band voice modulation (NBVM). Both systems offer dramatic improvements over AMPLITUDE MODULATION (AM) and FREQUENCY MODULATION (FM) for long-distance voice communication and have increased the number of stations that can use a given portion of the crowded radio spectrum (see TELECOMMUNICATIONS)"

What is NBVM please? I think CQ or QST published something on it but our local library does not have indexes for these journals. Can anyone help?

I hope so. ARRL Radio Designer does not include schematic capture and
has never been advertised as including it. We'd appreciate anyone
pointing out advertising material or reviews that have carried
statements or implications to the contrary.

: Cecil, I'd love to know how exactly you did that (cap. value, wiring).

Hi again Isaac. I just realized that I didn't answer your question. My capacitor is a 0.09" spacing 20-180pf that I got from Fair Radio Sales for $10. It handles 600w just fine. It is mounted on a pair of #6 wire rails spaced about 3 inches apart and two ft in length. The capacitor slides back and forth on this 2 ft length of parallel feedline like a train car on tracks. This gives me an analog positioning of the capacitor to ensure a perfect SWR on all frequencies on all bands. I use the 32/16/8/4/2 ft relay-selected Ladder-Line Length Selector for the course adjustment and the capacitor on rails for the fine adjustment. Ladder-line and one cap - gotta be close to minimum losses.

Steve you have a classic Heising modulation transformer used years ago. The higher current winding starts at the high voltage feed point. The center tap goes to a class A audio modulator tube. The lower current winding is then connected to the RF final amplifier. Great system-- works well, can not be overmodulated! Cliff Buttschardt W6HDO/K7RR

The '62 Handbook only has a circuit using a single 4-250A for
6 meters and a push-pull 4-125A design for 2 meters. The '71
and '72 Handbooks show a single 3-500Z design for 6 meters.

Sorry I can't be more help, but I don't have any other years
close to the range you mentioned. Perhaps the circuit you're
looking for is between these years.

Some of the best construction articles and HF amplifier designs have been published in ARRL Handbooks between approximately 1960 and 1980. In addition, these books have chapters on power supply, vacuum tube and amplifier theory that complement the articles. You should look for as many of these books as you can find, particularly those that show articles designed around the tube(s) you want to use.

Regarding tubes, the 811A and 3-500Z triodes are among the best on the basis of "dollars per watt". For the ultimate in legal limit power (although at higher cost), the 8877 is hard to beat.

Addressing some of these questions:

I don't think there is a way to use a magnetron from an oven
in a system using low level VSB modulation.

I have found that, in my area, most ATVers are not homebrew types.
They can only use what is on the amateur market. With the exeption
of the AEA transmitter, which I believe is no longer produced, all
of the AM ATV products are double sideband. Even if somoenoe were
to employ a low level modulator, there are no amplifiers on the
amateur market with good enough IMD perfromance to preserve the
integrity of a VSB spectrum.

FMTV is a great way to go on the microwave bands where there is room for it. Anyone who has seen the difference between a good satellite feed, and the video from a AM TV broadcast would understand why. There is also a big threshold advantage of FM video over AM. I have long been a proponent of ATV repeater systems which have FM inputs (which make for inexpensive transmitters and better picture quality) and VSB-AM outputs (which make reception by users easy and confines the high cost of a good VSB transmitter to the repeater only).

Hope that helps.

********** 2 Meter AND 70 cm BANDS THREATENED
****

THIS IS NO JOKE!! ARRL HAS LEARNED THAT IN
PREPARATION FOR THE
WORLD RADIO CONFERENCE IN 1997, REPRESENTATIVES OF THE
LOW-EARTH-ORBIT
(LEO) INDUSTRY PROPOSED A LIST OF CANDIDATE
FREQUENCY BANDS FOR
REALLOCATION TO, AND EXCLUSIVE USE OF THE MOBILE SATELLITE
SERVICE. THIS
LIST INCLUDES 144- 148 MHZ (THE CURRENT AMATEUR 2 M BAND)
AND 420-450 MHZ
(THE CURRENT AMATEUR 70 CM BAND)!
IF THIS EFFORT WERE TO BE SUCCESSFUL, IT WOULD
MEAN THE END OF
AMATEUR OPERATIONS ON THESE TWO MOST HEAVILY UTILIZED
AMATEUR VHF/UHF
BANDS!

I have included the text of Dave Sumner's upcoming
editorial for
July QST in this bulletin. ARRL, as the principal
representative of
Amateur Radio in Washington, is actively pursuing this
issue as this
bulletin is being written. Dave's call to action is
serious!! We could
lose these bands if we do not take action now!!

Club presidents and newsletter editors:
please make this
information available to your membership as soon as
possible.

Follows the text of Dave Sumner's July QST editorial:

WRITE NOW!!!!

Get out a pen and paper, or boot up your computer.
There's work to
be done! Your help is needed to defend two meters and
70 cm. Yes,
that's right -- the two most popular and crowded amateur
VHF/UHF bands!
But don't panic, and don't "go ballistic."
Here's what's happening, and what you can do about it.
The United States is preparing for the 1997
ITU World
Radiocommunication Conference, WRC-97. In the past, the
public has been
able to participate in the preparations for such
conferences by
responding to FCC Notices of Inquiry. In March, the
FCC announced a
streamlining of its International Bureau's preparatory
processes for
WRCs. Under the new scheme, the NOIs have been
eliminated in favor of
increased emphasis on WRC Advisory Committees.
For WRC-97, a series of Informal Working Groups
(IWGs) of the
Advisory Committee has been created to address specific
agenda items.□
The output of each IWG will go directly to a joint
FCC-NTIA-Department of
State Steering Committee of the Advisory Committee.
There, draft
proposals as received from the IWGs will be reviewed and
forwarded to the
FCC for possible release as preliminary U.S.
proposals for public
comment.
In announcing the streamlined WRC preparatory process,
the FCC tried
to reassure those who might be concerned about reduced
opportunities for
public participation: "Interested parties should note
that input to the

Advisory Committee may be sent at any time directly to the Chair of the WRC-97 Advisory Committee; the Chairs of the Advisory Committee's Informal Working Groups; Cecily C. Holiday, the FCC's federal officer of the WRC-97 Advisory Committee, or to Damon C. Ladson, the alternate federal officer."

Hold that thought while we shift gears to the substance of the issue.

One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile-satellite service.

So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL☐ technical relations staff participates in IWG-2A to represent Amateur Radio interests.

At the May 7 IWG-2A meeting, an industry representative proposed a list of "candidate bands" for little LEOs. The list includes a number of bands that would negatively impact existing services, and does not include others that would be technically more feasible but to which strong objection from incumbents could be expected -- the point being that some political, rather than purely technical, judgment already has influenced the list.

Incredibly, 144-148 and 420-450 MHz were included on the list! This is the first time in memory that another service has been proposed for the two-meter amateur band. We must make sure it is also the last time.

We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide

the backbone of
our local public service communications effort. Voice
and data, mobile
and fixed, even television -- the list of present amateur
uses is a long
one, and of future uses is even longer. Both are
already used for
satellite services and for moonbounce and
extended-range terrestrial
operations requiring extremely sensitive receivers and
high levels of
effective radiated power.
Apparently we did need to explain all this to
the little LEO
industry representatives, so we did just that -- both at
the meeting and
in a followup letter on May 15. We also explained that we
had to regard
the matter as extremely serious. No one with the slightest
background in
radiocommunication could possibly believe that a
mobile- satellite
service could be introduced into either band without
disrupting existing
and future amateur operations. Therefore, we said, if we
did not receive
assurance that they would be taken off the list of
candidate bands by the
deadline for this issue of QST, we would have no choice but
to bring the□
matter to the attention of the entire membership.
The response we received was unsatisfactory. In
effect, we were□
told the little LEO industry would consider our views
but that until
their spectrum needs are satisfied, all bands must
remain under
consideration.
So, this is a call to action. We must get across
to the industry
and government participants in IWG-2A that the 144- 148
MHz and 420-450
MHz bands cannot be considered as candidates for
mobile-satellite
services. We need to drive the point home so forcefully,
with so many
grassroots responses, that no one is ever tempted to try
this again.
Which brings us back to that invitation for

"interested parties" to
send input "at any time." There's no time like the present!
Here are the
key addresses, including those of the mobile-satellite
industry folks who
seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington,
DC
20554; choliday@fcc.gov; FAX (202) 418-0748.
Warren G. Richards, Chair, IWG-2A, Department of State, CIP
2529, Washington, DC 20520;
richardswg@ms8620wpoa.us-state.gov; FAX (202) 647-7407.
Tracey Weisler, FCC Rep., IWG-2A, International Bureau,
FCC,
Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.

Mary Kay Williams, Final Analysis, Inc., 7500 Greenway
Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.
Leslie Taylor, President, LTA, 6800 Carlynn Court,
Bethesda,
MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who
are simply doing
their jobs. We have to get across that casting covetous
eyes on amateur
bands is counterproductive, and contrary to the public
interest. To
accomplish this we need a lot of comments, including yours.
But remember
that the objective is to educate and persuade, not to
intimidate. We
don't need to. The facts are on our side.
To monitor the FCC's ongoing WRC-97 preparations,
visit its WRC-97 home page at:
http://www.fcc.gov/ib/wrc97/.

First off, you'll need a license if you're going to transmit
anything. It'll never work on CB, so you'll have to study up
a bit and get your ham license. (No Morse nec, since in
this case you'd only be using vhf.)

Then look at a subject called "Packet Radio"
However, due the large bandwidth needed, switching
speeds are rather limited. Can you live with 1200 baud?

I seem to recall a 10 Mbps + voice microwave link from the ARRL
handbook.

It used two of the pretty cheap gunplexers, and was full duplex.

Seemed like they had an ECL feed .

Given that much, you still have to add a protocol layer, and software
to support it. Maybe you can make tcp/ip work....I don't know much
about that, except enogh to have great respect for those who do!

They had snow-saucers for dishes, but at half mile, I suspect the
horns alone would have sufficent gain.

I've had bad luck running modems over anyuthing other than tel-co
circuits...they are pretty much tweaked for that service.

3593. Did anyone build AT-11 autotuner in Jan '96 QST?

Source record: 104921

I do a fair bit of mobile HF operation. In the past I have used Hustler resonators and a 9 foot mast
for 20 and 40 meter operation. Recently, I considered buying a SGC tuner and using a cheap CB whip on
the back of the car, but I was put off by the cost of the SGC tuner.

Has anyone built the AT-11 autotuner that was featured in January 96 QST? Seems to be a well
designed circuit. Does it remember settings from band to band or must it go through the retuning
process every time I go from 40 to 20 or vice versa?

All comments are appreciated regarding this kit and/or the SGC Smartuner.

Thanks,
Ernie KS4Q

Bought at Dayton new, but no specs and need working voltages:

ANZAC MD-112-3 0.01-12 GHz mixer in big yellow box. Has input for diode bias!
Has schematic on case so can probably play with the bias a bit, but would be
nice to have the bais data

Microsource YIG OSC 10.0-18.0 GHz. MS01018-236-01
Needs +15 v. and probably can start with low current on tune inputs to find
what gets me where I want to be. Would be nice to have heater voltage.

Thanks,
Lawrence E. Stoskopf, M.D.

Hi Brian, just because maximum voltage occurs at the center of a dipole doesn't mean it won't radiate (unless, of course, one is using coax to feed it directly. :-)

One of the very interesting things about 450 ohm ladder-line is that the SWR will be the same when feeding a 45 ohm half-wave dipole and when feeding a 4500 ohm full-wave dipole. That means that the SWR is somewhat consistent when using 450 ohm ladder-line so it really doesn't make any difference what the length of the dipole is (as long as it doesn't go below approximately 3/8 WL).

I can't help with the mixer, but most YIGs I have seen have 24V heaters.
I have played with several that I picked up from fleamarkets and have
had no trouble firing them up, not knowing the tune currents, by using
a power supply with adjustable current limit.

Typically, I start at zero current at which point the YIG shows no
signs of oscillation. Increasing the current slowly, you will reach
a point where the oscillator starts, so just start plotting your
frequency vs. current chart there. If you have gotten up to 700mA
or so and have not seen any sign of oscillation, the beast is probably
dead. Note that you generally don't need the heater connected unless
you just want the added temperature stability.

Good Luck

A simple approach is to use Direct Digital Synthesis (DDS) integrated
circuit and a mixer. DDS chips are sold by many firms like Qualcom and
Analog Devices. You will probably need a microcontroller to interface
from your front panel controls to the DDS. If your knowledge of
electronics is sketchy, a PLL circuit can be very difficult to design
and build if you want a clean signal. A DDS does not have the
istability problems common with PLL's. Check out the Analog Devices
web page (www.analog.com) for their new DDS chip, the AD7008. It looks
like a pretty good unit.

>works well, can not be overmodulated! Cliff Buttschardt W6HDO/K7RR
>
Hi Cliff,
The transformer he has can also be used with the center tap connected to
HV, and a modulator tube at each end. The high current end feeds the PA
through the RF choke.

If fed the way you mentioned, modulation can easily exceed 100% on
negative peaks.
In that way it is superior to a conventional Heising choke modulator with
no dropping resistor between the modulator and the PA. The transformer
offers a 1:2 voltage step-down in the negative modulation direction.
Positive peaks are a problem with that scheme, since the HV rail is at the
end of the autotransformer. It will be impossible to reach 100% positive
modulation without distortion, unless a bypassed dropping resistor is
added between the PA and the modulator.

With the push-pull scheme (two modulator tubes with the HV going to the
CT), PA modulation is more symmetrical and 100% modulation can be
achieved in both positive and negative directions with low distortion.

I'm also interested in a solid state final. I have an old Uniden 2020,
which has been unuseful for years, because its tubes (2x6146B) and
transformer burned. It may be too expensive to repair the rig, so
a simple low-power solid state PA would be the solution. The receiver
works well with 12V DC, so I don't need a heavy transformer. In fact,
the rig would be nice in a field day use.

: Pete/wa4hei

Pete -

Have you considered using glass blocks as insulators? Glass is very strong in compression and blocks are made in many different shapes. If the tower is guyed, not self-supporting, the legs are always in compression, never in tension. But if the HDBX is self-supporting, ignore this message.

For a guyed tower, my guess is that you could easily attach a flange at the bottom of each tower leg with a skirt shaped to confine it on top of the block. The underside of the block would have to be confined, also, so that it doesn't shift laterally.

Good luck!

Tom, something here doesn't make sense. Let's back up a little.

I asked:

>Once the pi network is resonated and tuned for a match to the
>load, won't the power factor be unity at the plate of the tube,
>as well as at the output of the network?

You replied:

>Not in the middle of the network.

Then I asked:

>Tom, do you mean in the middle of the inductor?

You replied:

>No, in the middle of the resonant network.

OK, help me with this. You've agreed (I think) that once the network is tuned, the power factor at the plate of the tube is unity, and the power factor at the output of the network is also unity.

Now, one end of the inductor is connected to the plate (through a blocking capacitor) and the other end is connected to the output of the network. This means that both ends of the inductor are connected to points which exhibit a power factor of unity. Under these conditions, where exactly is the VAR that's causing the problem?

>You can connect "extra" grids of pentode and tetrode's to
>control grid and "make" a triode if you find a good deal on them.

Oh no you can't - not without risking lots of problems.

Think about it. In most tetrodes, G1 is designed to be operated negative of the cathode, and G2 several hundred volts positive. Also G1 of a tetrode is designed with a much smaller dissipation than G2, and will handle much less current. If you simply strap all available grids together and apply RF drive, G1 will get much more grive voltage and current than it needs, and G2 will get much too little. In most cases the result is an excessive drive requirement, poor intermod performance, damage to G1 and shortened tube life.

That's the simple explanation. For full details, consult the characteristics of the tube you're proposing to use, and see what happens across the whole drive cycle.

It just so happens that the most common post-war tetrodes available to amateurs (807, 813, 4-125A etc) will sort of tolerate this treatment. These are actually exceptions, but it has led to the myth that you can make a triode out of any tetrode. Well, you can't, and at modern tube prices you may be in for a nasty shock.

The classic case was the NAG linear for 2m, which some cretin "designed" using a 4CX with both grids grounded. Not a 4CX250 even, but an expensive 4CX350 which has a zero grid current rating! Tube life was a few hundred hours maximum before G1 expired, and often much shorter.

>
>Some of the Russian tubes look pretty good. It may be worth designing
>around these.
...except that they're mostly tetrodes.

Tetrodes are wonderful, but they do need well-regulated positive screen-grid supplies, even if G1 and G2 are both grounded to RF.

It's been called to my attention that the article in May 96 QST has an error pertaining to the winding data for the 9 MHz inductors. The ARRL draftsbutcher has this incorrectly listed as 8 tri-filar turns of #30 wire. The correct information is 15 turns of #30 wire, the core material and other info is correct. I HIGHLY recommend writing the author or the League for the template if you plan on building this amplifier. Not only are there no errors of commission, there's lots of additional information not contained in the article.

In the circulating currents in the tank.

The capacitor does not tune out the reactance of the tube, it actually is much low than the plate impedance so the source looks like a low shunt Z capacitive source, same with the load. That's why the network transforms impedance and has selectivity.

Looking at the ends of the network doesn't describe what is going on in the center at all. Same problem with a balun feeding a reactive load.

Good detail Ian, and something many people writing articles never
consider. Screen (and in cases even control grid) regulation is very
important.

Very few tetrodes make good triodes, although there are a few exceptions
that seem to work OK (like the 4-1000A and the 4CX5000A). It's luck of the
draw rather than planned sucess when one works well.

3607. Q: Help needed for high BW Tx/Rx design

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-05 00:00:00 UTC
From: jgwr@waikato.ac.nz
Message-ID: <4p444e$18g4@thebes.waikato.ac.nz>
Source record: 104839
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

As a core part of my MSc thesis project I need to transmit a digital data stream of about 380kbps (kilo-bit/sec ie approx 32Kb/sec) from a standalone device to PC. The total transmission distance will be about 5-10m. The twist is that as the device can move, there must be no physical impediment to its progress; so no wire, and its got to be small and light. Also, as the device runs on batteries, the transmission system must be low power.

I've decided to use a wideband FM radio system... but as neither I nor my supervisor know much about RF devices, I have a few unanswered questions... so here's a summary of my ideas and questions so far:

I was planning to use a transistor to 'pull' the frequency of a crystal locked oscillator in response to my digital data stream. Then frequency multiply this signal to >100MHz- which would also have increased the frequency deviation, and hence increased the recieved signal-to-noise ratio.

But I'm dubious as to weither a transistor would be able to modulate the osciallator frequency at such a high data rate (given that I was looking at a very simple oscillator circuit)...

(It would have been a useful learning exercise- and given me an excuse to learn how to use SPICE- BUT I'm running out of time :-/)

So I am wondering if a more 'direct' approach will suffice:

LPF the digital data stream, so that the high pulses become approximately sinusoidal, with a fundamental frequency (f2) of the actual _bit_ length (not the data rate!).

Feed this into one input of a double balanced mixer; the other from a local oscillator, set to the 'space' (ie data=low) frequency (f1).

HPF the mixer output, so there are only f1 and f1+f2 present.

To recieve: build an FM reciever with a bandwidth >(f1+f2)/2, tuned (ie centred) to a frequency of f1+(f1+f2)/2.

Hopefully (with a bit of luck): recieve data= transmitted data.

I realise that with this scheme I will have no control over the modulation index, and hence the transmitted signal-to-noise ratios- and probably a whole heap of other things besides (especially as I'll probably have to experiment with a couple of data rates). But in principle I can't see why it shouldn't work.

Now for a more detailed question:

I'm looking to use Philips' SA602 or SA612 DBMs, or the mixer stage of a SA615-due to size, availability, and the Philips' data books have been the most useful/understandable/comprehensive data books I've looked at so far :-)

BUT these chips are designed as reciever mixer/IFs :-(
(ie RF freq. LO x RF -> (lower freq) IF)

Will they/should they/could they work as I require?
(ie low freq. modulating signal x RF freq LO -> high freq RF)

Ok guys, where are the mistakes in the above?

What do you suggest I investigate/correct/replace?

I will _really_ appreciate any advice on the above- as I mentioned before RF is a completely new ball game to me! (ie the hair I'm losing can't be due to EM fields- 'cause I ain't got anything working yet!)

Regards

Julian Rendell

Someone sells these, I've seen them, although I don't know who.
THey're made of Cu tubing (1/2" OD) with a center shaft made of
smaller CU tubing which fits over the center conductor of the
hardline. the outer Cu tubing is held on to the hard line by a hose
clamp. Looks nasty but I know someone who has them up on his
tower and he's had no problems with them.

Oops, I looked that article up last night.

I found it in '93 handbook.

It was designed for "only" 2 Mbaud, and used "real" dishes, albeit
snow caucer sized.

Author indicazted 10 Mbaud should be doable.

Carrier was 10 GHz, and author indicated a 24GHz version had been
built, differing only in the gunnplexers used.

> I want to
>cover 160m-10m at least, preferably all the way up to 2m or 70cm.

Aw, come on, why not go for DC to gamma coverage? <g>

Seriously though...the HF coverage is just doable.....going for VHF as well is awfully ambitious. There are many good reasons why HF, and VHF rigs come in two boxes instead of one! (Ok, there are execptions I know!)

DDS chips will go DC to ~ 20 Mhz.

You can use one to drive a PLL and get "n" times the coverage, BUT the PLL can only cover less than an octave.....(Yes this gives you n times resolution, but most DDS chips tune to fractional Hz, so no problem.)

What is generally done is to take the range (say 1-30 Mhz) and generate it at a higher shifted range, say 41-70 Mhz. This is then hetrodyned down to desired range, say by beating against a 40 Mhz crystal oscillator, and LP filtering. Doing it this way lets you use One low pass filter...other schemes require bandpass filters which must tune or be switched. All general coverage HF rigs use this approach.

A more direct way is to "pretune" the PLL to approximatelly right frequency, thus limiting range....maybe you could get a decade of range this way..but I doubt that much. 3 octaves more likely.

Yeah...complicated. If you can come up with a simple way to do what you discribe, patent it fast. This is one of those "classic" problems that a lot of people have tried to solve. All the successful approaches have involved some "back door" technique as discribed above.

Brain Olliver offered some interesting comments on this thread which were close to the mark, but off a little. I was likewise under the impression for a long time that 2400 MHz was chosen to be resonant at a frequency for water absorption. This isn't true. Water absorbs up in the 120 GHz region (I don't have my references on this at work) and one or 2 other regions.

2400 MHz was chosen because the FCC (and others I guess) gives certain bands for ISM (industrial, Scientific, Medical) uses. It just happens that 2400 to 2450 MHz was a convenient industrial frequency to use (and cheap!!). Food absorbs these frequencies, but just not as well as it would at the resonant frequency.

Brain's main caveats hit the bullseye. These devices typically put out 600 to 1200 watts. This can cook just about any carbon based lifeform in short order. These are not to be taken lightly. There is an entire chapter in both the ARRL Microwave books regarding safety at these frequencies. They give some idea of how far away you need to be for a given power level and frequency. It is actually a lot closer than you might imagine, but my eyes are my livelihood, so I am *VERY* careful with anything above about 144 MHz.

Now after all of the "protect you from yourself" rhetoric, there was an excellent article in Volume 1 Number 1 of Communications Quarterly magazine. It went into great detail on using a magnetron for a transmitter. Brain is probably right that finding a way to pulse modulate the beast is the best way to send information. Magnetrons are not especially frequency stable (by HF/VHF measures) so you will need an AFC circuit at the receivers unless you want to spend megabucks for the circulators to injection lock the magnetrons. Again the article addresses those issues.

I am amazed at how cheap a brand new oven magnetron is. I have seen them for sale at MCM electronics for under $100. It's a pity they are so hard to use for typical weak signal work.

3616. Accuracy of Amidon toroid data?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-05 00:00:00 UTC
From: jathomas@netcom.com
Message-ID: <jathomasDsJ47B.DMG@netcom.com>
Source record: 104848

I'd appreciate any input on the accuracy of the toroid winding data in the Amidon literature. I decided to measure the inductance of some cores I was making for a project, with suprising results:

Core Calculated L Measured L

T-37-6 154 nh 302 nh
7 turns

T-50-6 365 nh 644 nh
10 turns

FT-50-43 23 uh 28 uh
7 turns

The tests were made with a parallel L-C circuit connected to a signal generator through a 1K resistor. Resonance was detected with a scope. I independently measured the capacitor value and checked the signal generator frequency. I can't believe the data is this far off. Any ideas?

I'm disappointed to hear this. I've often thought about ATV, but my primary interest would be building the equipment and experimenting with circuits related to signal integrity. Doesn't sound like there would be many people on the air to share those interests with.

>Even if somoenoe were to employ a low level modulator, there
>are no amplifiers on the amateur market with good enough IMD
>perfromance to preserve the integrity of a VSB spectrum.

The IMD performance of the amplifier may not be as significant a factor as you believe. The 1 dB compression point of the final device(s) can be greatly reduced when split visual/aural amplification is used. The primary intermod component in video occurs as a result of the simultaneous presence of these two carriers within a single amplifier.

Also, what is the typical visual/aural ratio used in Amateur AM transmissions? U.S. broadcasters (at VHF/UHF) employ a 10 dB ratio, but this can be substantially reduced with no degradation of the recovered audio. Ratios as low as 20 dB have been shown to be entirely acceptable, and in some countries, for purposes of minimizing adjacent channel intermod, 17 dB is the legal maximum. The reduced amplitude of the aural carrier that results from these ratios not only significantly reduces intermod, it reduces the power requirement and cost of the aural amplifier chain.

At the output of the two amplifiers, either a passive combiner (directional coupler) or a tuned diplexer can be used to combine the two carriers. I suppose either of these could be homebrewed at reasonable cost, but the directional coupler is particularly appealing because it can be etched on a PC board.

I could be wrong, but I'll bet that between reducing the aural carrier level, using split visual/aural amplification, and generating low-level VSB rather than DSB, a major performance gain in Amateur AM TV would result.

>I have long been a proponent of ATV repeater systems which have
>FM inputs (which make for inexpensive transmitters and better
>picture quality)

Is this necessarily true in Amateur work? How does the linearity of a very wide bandwidth, homebrew video FM modulator and detector compare to AM modulation? Commercial FM systems are much more expensive than AM in this area, presumably due to the difficulty of achieving adequate linearity.

Regarding signal thresholds, do you happen to know what the minimum carrier/noise ratio is generally considered to be, in order to provide a "perfect" picture in FM work? I know this is a subjective measurement, but perhaps some of the commercial FM manufacturers have published ballpark figures.

>it is so insidious because you can't see it

At least at microwave frequencies, the eyes are the most vulnerable to damage, and the effect is usually so gradual that the individual doesn't realize what is happening until it is too late. Effectively, exposure to microwave causes the clear material in the eye (including the lens itself) to gradually cloud from the heating effect. This causes the amount of light impinging on the optic nerves to be slowly reduced (through repeated exposure), and the subject gradually becomes blind, or nearly so.

It is very likely that many persons who work around transmitting antennas or high power microwave equipment suffer from this condition, although the effect may not be sufficiently advanced for them to be aware of it.

One of the worst examples of ignorance I ever saw was a photo on the cover of a microwave journal a few years ago. In the picture, the owner of a multichannel 2.5 GHz video transmission system was shown on the roof of the building, standing next to the two omnidirectional transmit antennas. Each antenna had 14 dBi gain and was being driven by multiple 10 watt peak output amplifiers. I called their facility some time later to ask if the transmitters had been switched off for the photo, and was told they didn't do that because of the service disruption it would have caused to existing subscribers.

3620. Re: Did anyone build AT-11 autotuner in Jan '96 QST?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-05 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4p4i5s$d0@pacific.mps.ohio-state.edu>
Source record: 104852

I've recently completed an AT-11 kit, and offer the following comments:

1. The circuit board traces are much finer than necessary and make assembly more difficult than necessary. A very small iron and magnifying glass are essential. Deflux the board with anhydrous alcohol. Otherwise, assembly is straightforward and takes about 5-7 hours.

2. Don't buy the optional cabinet (made by Ten-Tec). The asking price is outrageous, and the cabinet is just two U-shaped pieces of metal. The company doesn't even provide the cabinet screws, mounting feet, or strain relief for the power cord. Use a Radio Shack cabinet instead.

3. Early versions of the AT-11 generated loud birdies on the upper frequency bands. The latest versions shut down the CPU after a few seconds, eliminating the problem but making the AT-11 a bit less "friendly" from an operational point of view.

4. Electrically, the AT-11 works great. It matches any reasonable load, and does so in a few seconds. The built-in SWR indicator (using LEDs) is helpful. The relays make a racket while the unit is tuning itself, but only for a second or so.

5. If you provide your own cabinet, the AT-11 is a great buy. It seems to work better than my Icom AT-180, which cost nearly $500.

There is indeed a vibrational mode of water molecules near 2400 MHz.
The angle formed by at the oxygen molecule oscillates, that is the

```
H H
\ /
O
```

distance between the two H's varies, with a resonance near 2400 MHz.
As the vibrating molecule bumps into other molecules, the energy in
this vibration is transferred into motion of the molecules and the
substance is heated. This is the principal mechanism by which microwave
ovens turn the RF into hot food, and it also explains why dry substances
(e.g. glass, ceramic, many plastics) aren't heated by the microwave.
If you put two glass tumblers in your oven, one full of water, one empty, in
your oven and zap them, the empty one will stay cool, confirming that
it is the water and not the glass that is absorbing the RF. The heating
is much more efficient with liquid water than water vapor, which is why
microwave cannot generally heat food above 100 C, and why you rarely hear
of them exploding from the steam pressure. (This latter might be a problem
with ovens operating at the 60 GHz or 120 GHz water absorption lines.)

In addition to the vibrational mode, I think that there is also a rotational
mode of water molecules excited by 2400 MHz. There are also relevant modes
in other molecules. Most fats are heated by microwave ovens and can be
heated to their boiling point (this is why you can char bacon but not
brown bread.) I think that the mechanism for fats also centers around
vibration of an -O- bond, e.g.

```
H C C C
\ / \... or .../ \ / \...
O O
```

but I'm not sure of this. Not all `fatty' molecules work--parafin (I mean candle wax, as I haven't experimented with kerosene) isn't heated well in a microwave oven.

It's certainly true that 2400 MHz was chosen as much for convenience as any other reason, and that's not the most efficient frequency for coupling RF into heated water, but efficiency isn't really critical in the context of an oven. It doesn't matter if your RF is absorbed on the first pass, or if it bounces around a bit first--it's in a Faraday cage, so there's no place else for it to go. It'll get absorbed eventually. However, it does mean that the magnetron has to be designed to operate in the presence of a lot of reflection (i.e. a poorly matched load.) If the RF-water coupling were too efficient, you might end up heating the vapor instead of the liquid, which would mean the oven was less effective for cooking food.

Note that the coupling at 2400 MHz is efficient enough that only about 1-2 cm of moist solid is enough to absorb all the RF. If you cook something like a roast in a microwave, only the outer layer is heated by the RF. The center will only be heated by conduction, just as with a conventional oven.

I second remarks others have made about safety considerations. Human bodies are full of water and fats. Despite the `inefficiency' of the coupling, people are also big enough that if you get in front of a 2400 MHz, all that RF is going to heat you, and 600-900 W is enough to burn you fast.

Very good and doable ideas, but beyond the abillities and
budgets of most ATVers. The output of our repeater system is
2.4GHz VSB-AM upconverted from a Scientific Atlanta CATV
modulator and amplified to 20W with a very linear TWTA. The
Audio to Video backoff is about 15dB which seems to work
well and the undesired lower sideband product is down about
-60dB from the video carrier.

The amateurs have adopted an FMTV standard which is similar to
commercial terrestrial FM video standards. The result is an
occupied BW of about 12 to 16MHz (not much wider than DSB-AM).
Reasonable linear VCOs are not that difficult to do over this
bandwidth at the amateur bands of 1.2GHz and above. I've even
used Gunnplexers with good success. Everything after that is
class C. No need to tweak drive levels and bias for linearity.
It gets rid of the problems with people thinking that the highest
possible wattmeter reading will result in the best picture
quality. A mistake often made by the appliance operator.

>

Typically for the bandwidths mentioned above, the video is snow
free at a C/N of 10 to 12dB for FMTV. Typically, in an AM TV
system, your C/N translates almost directly with the S/N observed
on the screen. The eye likes to see about 45dB S/N or better on
the CRT to say "good pictures". This translates into a big
advantage for FM. In fact, folks are running 1 or 2 watts on FM
to get perfect pictures into the repeater VS. 50W PEP or so on
AM for the same picture quality.

Hope that confuses matters further.

Hi Cliff, the subject needed an evangelist and I'm it, anointed by Mother Nature to solve the 50-ohm to ladder-line matching problem once and for all. That problem is what is keeping coax alive used with fixed balanced antennas. I have solved the problem. It is easy to do. It eliminates all the coax except the short run from the balun/choke to the transmitter. It results in a perfect SWR without a commercial antenna tuner. It allows a 102ft dipole to radiate as well as a perfectly matched coax fed 40m dipole plus it works on all the other HF bands just as well. Plus ladder-line is a lot less expensive than coax. Did I miss anything?

>generator frequency. I can't believe the data is this far off. Any
>ideas?

1. If the turns are all bunched up as opposed to spread out over most of the core, the coil inductance will be higher. This will have more of an effect for low-permeability cores than for high ones, which is borne out by your results. With mu = 1, that is, air core inductors - and the tan non-magnetic toroids, it makes ALL the difference how the turns are arranged. With mu = 10,000, it hardly matters at all.

2. Caps and your wiring have series inductance; this must be added to the inductor's "own" inductance. But with small ceramics, it'd be hard to believe they have a lot. Note, though, that the fractional excess of inductance is highest for the low values, and less for the big one - you have 100% too much inductance for the first two cases, and only 20% too much for the last one.

In addition, there is always stray capacitance, and a number that is oft batted around for that is 10 pF, which needs to get added to the total. Naturally, if your caps are much bigger than this, it won't make much difference. But then, those caps might start to have non-negligible inductance.

3. Permeability is a function of flux. Some cores increase their permeability by a factor of two or more when the coils are carrying some current, as opposed to the extrapolated zero-current value. But with a 1k resistor, this doesn't seem too likely either. Any idea how much current

was in the wires? Or how many gauss was (were?) in the core?

I think you've stumbled on a genuinely good question. Some of the Handbook circuits(1) give turns, core, *and* inductance for some components, and Behold! the asserted inductance is not consistent with the stated AL value of those cores with that many turns, so something is certainly up and you have brought it to light.

(Some of the VHF transverters in my 1986 Handbook, the 28 -> 144 and 28 -> 220, I think. Again, these are small inductors, a few hundred nH.)

Cecil:

I didn't get your original post. For two meters, this works... (just built one today)

Using type N connectors, construct a section of RG8/RG213 (non-foam) 7.5" long with connectors on both ends. Construct a shorted stub 10.5" long with a connector on one end. (I recommend that you put the connector on the open end :))

Use a type N tee to connect these together. The 50 ohm input is the open port on the tee. The 75 ohm port is the free end of the 7.5" section. I measured this with an HP3577 vector analyzer and a load consisting of two 150 ohm resistors in parallel across an N flange-mount connector. The return loss was in excess of 25 dB across the two meter band. At the optimum point, the return loss was >40 dB but because the load isn't this good, it's bogus.

I'm going to use two of these on a 150' run of 7/8" CATV line to my new EME antenna.

Special thanks to everyone that asked for a copy of my DTMF program. I
have
made the DTMF program available at my ftp site. You can still request it
by
e-mailing me at PDRUNEN@AOL.COM. File size is 91K.

For those not up on the program, this program decodes all 16 DTMF tones.
It requires a small and simple interface (2 chips). The interface cards
connects to the computer's parallel printer port.

The file dtmf_v11.exe contains the program which is complete and shareware
with the interface card schematic in the GIF viewing format.

To get there ftp to users.aol.com

login as "ftp"
Password as "your e-mail address"
then cd /pdrunen
then cd /dtmf
get dtmf_v11.exe.

You will also find a really nice windows based GIF viewer, VUGRAF13.ZIP
for
the taking.

Thanks!

====== response GM0CSZ / KN6WH
John , Maybe the meter sticks because pointer touches glass window .
Suggest ,first to remove meter from window cover . If still sticky
apply a current adjustable between 0 - 500 microAmp by means of a
variable power supply say 0-12 V (not critical) and a potmeter in
series with a fixed resistor .Put meter to be tested in series with a
digital multimeter with a low DC current range ,say 0-1 mA or an
analogue 0-500 microAmp meter and a digital voltmeter across the
meter under test. Apply a 50 microamp current to the circuit and if
necessary tap meter under test , while increasing the current until
meter under test indicates full scale deflection . The corresponding
current can now be read and the meter's internal resistance be
calculated (Ohm's law). A replacement meter can then be specified .
Succes with this very basic test.
It could well be that the meter pointer is bent and that the problem
is just mechanical.

> mike stewart
>mikestewart@4you.net

-hello
there's one thing about the net it is always entertaining
do you intend to kill your friend or just toast him a little
please be careful the frequency of microwave ovens is chosen
so that it will impart maximum power into anything containing water
i think at the last count the average person was 96% water

well if your still intent it can be done the microwave oven magnetron
is however a little crude, if you want simple comms arrange for the
high voltage to be switched on and off at a audio freq say 1000hz
then key that oscillator "bingo" morse
if you want audio as in speech then you need to read up on pulse width
modulation techniques and vary the time period that your magnetron is
switched on and off in proportion to the audio content

for effective communications on microwave you only need 5-10 mW for
up to 20 miles your magnetron is going to give 100 to 1200 Watts
it's a bit of overkill if you'll excuse the pun <_>
- you don't have to observe effects of radiation to be harmed cancer can
be a result also instant blindness can be caused, it is so insidious because
you can't see it

you could achieve the same comms with a sparking coil from a car and in com-
plete safety it just bites a little
have fun

Source record: 104927

I had the pleasure of picking up two GE Porta-Mobil rigs, you know, the ones that look like a skinny lunch box with the handle on top. Anyway they both work and are on 44.720, anyone know what needs to be done to get these rigs on 52.525?

I know how to get the freq I want and can certainly retune the inductors but are there component changes required?
I planned on just putting in some new rocks (as opposed to building up a synthisizer) and using them for Simplex.
Any input is welcome.

I think I have already seen an answer to your Grid current question, it
is RF. What I am more interested in is your GS35B design. I have one of
these as well, and 100W of drive. But I do not have the metalwork.

I suggest you run it at under 3000V. 2200V sounds better. You need
a 100W of drive to get the full 1500+ watts the GS35B is capable of.

Message-ID: <31B6B627.84A@execpc.com>
Source record: 104781

Hi!

I was just looking over the 1996 ARRL Handbook description on their
web pages... it mentioned a VLF transceiver that didn't require a
license.

Where might I find more details about this equipment and this band?
I'd like to give it a try if the equipment isn't overly involved.
(Yes, I know the antenna will be big.)

Didn't "Radio Electronics" have an article like this, where you could
build a VLF transmitter out of a quad-NAND gate and some BJTs?

It (the ARRL ad) also mentioned a "QRP Transceiver" and a "QRP transmitter".
What are those? I don't know that Q-sign.

I believe there is a "no-license" band somewhere around 160KHz, seems to me you had to be 1W or less, maybe 100mw or less, maybe CW only, no more than 50' of antenna and leadline combined. This is all long ago and very hazy. I think it had something to do with power companies wanting meters to report on their own over power lines. With LORAN and all the other VLF stuff it might be difficult to make contact with only 100mw and a VERY inefficient antenna. Hey wait a minute, isn't that what amateur radio was about? :)

And QRP is low power (under 5W), but I'm not sure if that's PEP or input power.

They are hard to use for typical weak signal work but I think
Non typical weak signal work is still possable.

Use a wideband receiver and then use digital signal processing to dig
the recovered data from the noise. This should result in the equivalent
of a narrow band receiver.

I would like to try this but other projects come first.

I stand corrected, Ian. I made the mistake of confusing common (not so these days) practice with the right way of doing things.

Don't suppose I could convice anybody that I was just testing them? <g>

The Handbook circuit that did this dissappeared several years ago, actually I think they also had a 250W Novice job that tied all the grids on a pair of 6KD6 sweep tube common.

Thanks for the useful info.

BTW, last QST (or was it two months back.....temporally challenged) had an article on retrofitting a "obsolete" commercial amp (Dentron was it?) with a Russian tetrode. Common cathode setup does have advantage of simpler, broad band input circuit. Might easily be worth trouble of screen supply if you were wanting to cover many bands. Also I suspect many would happily accept that extra supply to avoid mechanical coupling of input & output switching circuitry, Even if only going for 3-4 band coverage..

I don't think this would be a very practical thing to consider. A
better idea might be to find an AM radio card (if there is one)
and build a converter in front of it. Sort of like the HF to AM
broadcast converters made for cars. I think MFJ had one. You
would then be able to receive HF AM broadcasts. If you built
a BFO, you could then receive SSB if the tuning step size was
fine enough on the PC card.

I have not seen an AM card for the pc, possibly because of the
large amounts of RFI emitted by the PC in that frequency range.
I think an AM card would certainly need an antenna mounted away
from the PC to be useful.

Good Luck

Has anyone ever measured the HT of a microwave oven ? I see the replacement magnetrons in RS seem to have a maximum of 4.1 kV, but I was hoping that a scrap microwave might be a source of an HT tranny for a 4CX250 or 350. Perhaps they are all around 4 kV, in which case I'll have to look elsewhere. Anyone got a 1500 to 2100 V tranny they want to sell ?

The only problem with that is the basic circuit was poorly designed. The screen needs much better regulation, and the grid resistor value was poorly selected.

Also it is important to remember AB1 tetrodes are much more critical to adjust and operate than triodes. The likelyhood of having a nasty signal increases when tetrodes are used.

> >thinking of the distributed L-C type.
> >
> >Is there any information about how to do this?

1) You might be able to find a piece of coax small enough - but perhaps not.
2) You dont say the centre frequcy. Is it 145 MHz and you want 10 MHz
bandwidth or is it many GHz and you want a BW of 140 or 150 MHz ? A Low pass filter, might help, as its phase delay is 45 deg at the 3 dB point, so with approiate
choice of cutoff, it will do.
3) Etch your own transmission line ? Space might be too small to ensure adequate
isolation between different bits.
4) Build one with a bipolar tranny. Drive the base. The emmiter and collector are
180 deg out of phase. Put a series L and C between the emmiter and collector. The
junction of L and C can then be varied over nearly 180 deg.

Its supposed to be.

> What are the loss characteristics at 432 & 1296 ?

Sounds like some stuff a friend and I bought in Dayton. Right down to the humongous connectors already attached. With stainless steel braid strain reliefs to hang the cable ends from? Made by Times Wire & Cable? (now known as Times Microwave)

Can you get more for a good price? I got N adapters with mine, but would like to more about what I'm adapting from.

The seller at Dayton said it was good for 0.55db/100' loss at 2m, and that's what I measured on mine. Got about 1.6db/100' at 440, more than I would have expected but I don't really trust my What Meter that was used.

Hi Jack,

In article <4p600e$97g@crash.microserve.net>,
jackl@pinetree.microserve.com (WB3U) writes:

>Well, you lost me here, so let me ask two questions. When the
>network is terminated in a 50 ohm resistive load and tuned to
>resonance, will it present a resistive load to the tube?

Close to it, even if the load is reactive.

The a proprerly tuned network compensates for the reactance at the anode (and load), so the impedance looking into the network will actually be the complex conjugate of the RF source impedance as average over the entire operating cycle. This is true only when the network is tuned for maximum output (and maximum efficiency) under a given set of operating parameters.

>Also, if the network presents a resistive load to the tube,
>will the the power factor at the input to the Pi be unity?

Sure, but the power factor in the network itself will not be unity.

>What I'm looking at are the two ends of the inductor. To me,
>they appear to be the same two physical points as the ends of
>the network. Because of this, I'm having a little difficulty
>distinguishing between the center of the network and the center
>of the inductor. You've said they're not the same, so can you
>please tell me exactly what point in a Pi network you're
>referring to when you say "center of the network"?

Between the components that have reactance. Look at the example of a generator in series with a resonant coil and capacitor. We can excite the circuit and measure the voltage across the generator, let's say it is one volt. If the Q of the circuit is 100 the coil will have 100 volts across it, and the capacitor the same.

If we put the coil and capacior in parallel across the generator, the current will be 100 times the excitation current for a system Q of 100. (That's how Q meters work.)

So we can have a source, a black box, and a load. Even if the black box looks like a pure resistance at both ends (at one frequency), the current and voltage inside that box can be almost anything.

While the formula Amidon uses always works (as long as distributed capacitance in the winding is neglgb), we have to be careful we really know the voltage across the coil. It may not be what we think it is.

For example, you used the example based (I think) on a given supply voltage feeding a tube, and a given plate current, and a given output power. But the peak anode voltage can be many times the dc supply voltage when the amplifier is not conjugately matched (or over coupled) to the load. In this case the loaded Q of the tank will rise, and the heating will also rise. If we measure the RF anode voltage we would see it rise, even though the dc supply remained fixed and the output power decreased.

So if we KNEW the anode RF voltage was 1000 volts RMS, and the load voltage was 100 volts, we would know the RMS voltage across the inductor was between 900 and 1100 volts. In the case of a pi-network it would be very close to 1100 volts. But we better be sure we are talking about the RF anode voltage, and not the supply rail. In this case, the supply rail would likely be around 500 volts for a conjugately matched class B PA.

Obviously the inductor would get hotter or cooler if the tank were mistuned, so the correct core size only applies at the correct tuning condition.

That is why tank circuits arc and connections melt in some tuners and amplifiers. Power handling of a given core is reduced as loaded Q of the circuit increases.

>Also, I'm curious about the role of circulating current in this
>situation. The Amidon formula only requires that we know the
>RMS voltage across the inductor in order to calculate flux
>density. Given that fact, why would (for instance) 100 V RMS
>across the inductor cause greater flux density when the coil is
>in a Pi network, than the same 100 V in any other situation? If
>the voltage impressed on the coil is the same, I don't understand
>how more or less current can flow through the winding. Is it
>possible you're saying (in effect) that the voltage I've
>calculated across the coil, based on the operating impedance of
>the tube and the output of the amplifier, does not reflect the
>RMS voltage that's actually present?

Yes, that's what I am saying. The voltage you might expect, by simple rules of reasoning, may not be correct. Textbooks sometimes imply peak voltage can not exceed two times the dc rail in a PA. That is untrue, unless the class of operation is confined to class B or A. When the amplifier is improperly loaded the class of operation, as defined by the conduction angle of the output device, always changes. The peak voltage can soar to many times the supply rail; the coil will overheat, the capacitors, bandswitch, or output device will arc.

>Incidentally, I found a circuit like this in the '78 Handbook.
>It's a 160M transverter with a pair of 6146's and it uses a
>T-200-2 toroid core as the basis of the Pi network inductor.
>I calculated the flux density using the same technique as in
>my post, but with the parameters of this specific circuit. The
>results agreed with the construction of the toroid shown in the
>article, that is, a T-200 core appeared to be the appropriate
>size for the amplifier.

I assume you did a Chaffe analysis to determine the RMS voltage and current at the anode of the tube, and assumed the voltage there was out of phase with the load voltage? If so, that calculation is correct for that operating point. BUT.... if the loading capacitor is increased in value and the source no longer conjugately matched to the load, the voltage (and hence flux density and heating) will soar.

My point, that I may not have made well because I didn't want to get lengthy, was that things aren't as simple as the dc anode voltage and current as related to the load voltage and current. Lots of things go on.

While voltage as related to turns and given core parameters will ALWAYS work out correctly, we just need be sure the voltage across the coil is the voltage we expect at first glance. In the case of a balun, even though the load voltage is known, the voltage across the winding may be quite different than we expect.

I just wanted to point this out.

AmSoft announces the June 1996 release of its CD-ROM "The World of
Ham Radio". This CD-ROM contains the World's largest collection
of amateur radio, electronic, and engineering software, plus the
most recent FCC amateur radio license database available on CD-ROM.
The current FCC database includes calls issued up to 22 April 1996.
This software collection is the best available anywhere in the World
for electronics, engineering, and the hobby of Amateur Radio. Over
20,000 files and programs for the hobbyist or professional. Stop
by our WWW SITE: http://hamster.ivey.uwo.ca:80/~amsoft/ and see.

At $19.00 plus $4.00 Shipping anywhere in the World AmSoft has the
lowest price for any CD-ROM offering these services.

I don't have the book but...

QRP means "reduce power" but has been bastardized to indicate using low power,
whatever that means. Usually less than ten watts.

On the VLF band, you are limited to (as I recall) 5W and an antenna length of
50' INCLUDING the transmission line.

Good luck on the ticket.

3670. Empirical HF Receiver (long)

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-06 00:00:00 UTC
From: ddiamond@TRL.OZ.AU
Message-ID: <ddiamond.262.000C1C46@TRL.OZ.AU>
Source record: 104866

AN EMPIRICAL APPROACH TO BUILDING AN HF RECEIVER
(COMPUTAROCK II)

What follows appeared in the Australian Journal- "Amateur Radio" in October 1994, and was intended to encourage experimenters to have a crack at building a workable HF receiver. By posting it here, the author intends no criticism of the material contained in the excellent "UHP" RX thread running at present, but rather; it is hoped that the less well-equipped enthusiast may find something of value-

73, Drew, VK3XU. (Advanced receiver worker's; please do not switch off when you see mention of NE602's, there's more so please read on).

Have you built a number of radio and electronics projects? Maybe a linear amplifier, or a transmitter perhaps.
If you are contemplating having another go at some home brew, a receiver project comes highly recommended. Not only will a useful item be the product of our efforts, we also gain membership of that special club of experimenters who enjoy the magical delight of exploring the HF bands with a receiver that we have made at home. And to make the project even more interesting, cost can be held to low limits, in true amateur fashion, depending upon scavenging prowess.

A well-made direct conversion (DC) receiver can give surprisingly good performance, and these are adequate for uncrowded band conditions. However, to sort out a band packed with strong and weak signals, some sort of IF filtering will be necessary to provide more selective reception. Single-signal DC sets have been built and described, but are, I feel, more complex and difficult to construct than an 'equivalent' superhet design.

What follows are a few notes and a suggested circuit using locally available components, drawing upon my own practical work, and that of many other experimenters. An extensive bibliography of topical further reading is appended for those with a wish to burrow more deeply into the material touched on here, and have access to a State, Engineering, or Technical Library.

In the late 60's and early 70's, tube circuit technology and evolved to a point where receivers with impressive signal handling characteristics were the norm. Many amateur -built and commercial sets featured at least one 7360 balanced modulator tube, arguably the best HF receiver mixer ever to be mass-produced. Consequently, at about that time, when solid-state receiver designs began to be published, "transistorised" sets quickly gained a reputation for poor strong-signal performance, and were not a patch on their older tube rivals. Various solid-state devices gradually became available that gave acceptable performance, including the CA3028 (singly balanced), the 1496 balanced mixer IC, 40673 dual-gate FET, and the diode ring. Many 'serious' experimenters still favour the diode ring. However, in my opinion, they have several disadvantages; a rather large oscillator signal level is required (typically 5 mW), a conversion loss of about 8 dB is incurred, impedance levels are low (typically 50 ohms nominal), and therefore close attention must be paid to impedance matching for all products if the desired high level performance is to be realised. Nevertheless, moderately priced diode modules (e.g. the SBL-1) are available, and many published designs make use of the diode mixer. There are 'strong' active balanced mixers, including the SL6440 and SD8901/Si8901. Unfortunately, these devices are costly and not (at present, as far as I know,) easily available in small quantities in this country, although supply should improve soon.

Most of the circuits we see here (Australia)are European and American designs, which must cope with the thousands of powerful HF transmitters in those areas. Every amateur in the USA for instance, if you read QST, seems to have three neighbours just around the corner, each with a kW amplifier. Not a good environment for a weak receiver. In this region however, things are a little more relaxed, and in most instances we can generally get by with a less bomb proof, but far more build-able design.

Enter, stage left, the diminutive NE602 balanced mixer IC. This little chip and I have had a long friendship, and in that time I have grown to like it very much- although he has two undesirable characteristics. Firstly, he's not very strong. He may quake a bit when powerful signals are around. I've learned to live with that. By having a reserve of receiver gain (he contributes 15 dB himself), some RF attenuation 'up front' generally takes care of this problem. Numerous experimenters frown on RF attenuation used like this, and regard it as a sort of 'cop-out'. Nevertheless, it has gained acceptance, and even some manufacturers use an attenuator. On HF, natural

and man-made noise will usually be greater than the receiver front-end noise, so the point is perhaps fairly academic. Secondly, the 500 MHz bandwidth of the device makes it rather prone to TV and FM radio pick-up where the transmitters are close by. Building the receiver in a metal box, and including a 30 MHz low pass filter (if found necessary) takes care of this problem.

The first mixer must deal with all signals which pass through the input filter from the antenna. A doubly balanced mixer will considerably improve strong signal handling, and offer improved attenuation of any signals at IF. The NE602 is acceptable in this regard if the input signal is applied, and output product extracted 'in balanced mode'. I believe this is one aspect which is perhaps overlooked by some NE602 detractors. The product detector has only to deal with those signals which arrive through the IF crystal filter, so a dual gate FET will do a fair job if high input impedances are required, or a second NE602 would be fine if the 1.5 kohm input and output impedances suit the circuit arrangement.

For most amateur applications, an IF bandwidth of about kHz is required, which is readily obtainable with a home -made crystal ladder filter. Using cheap computer crystals, four-crystal filter, plus one for the BFO, will cost about $16 at present. The quartz units are manufactured in huge batches, and match each other very closely in frequency. Out of band attenuation can be improved by building the filter in its own little compartmented box. The bandwidth is largely determined by the value of coupling capacitors, and is best found by experiment. For 6 MHz crystals, 33 pF will give a 1.8 kHz BW, whereas at 8 MHz , about 220 pF will be required. Reducing capacitance increases BW. Obtain your crystals from one source, and check that they are all of the same make.

We must be very careful in our choice of IF and conversion crystal frequencies, always keeping in mind which bands need to be birdie free. Remember, a receiver is a sub-microvolt sensitive device. Harmonics of the VFO, the BFO crystal, and mixing products of these and any converter crystal (if in use) can produce bothersome spurs at spots in the tuning range. Let's try an example; say we choose a crystal filter IF of 6 MHz, and our basic tuning range is to be 3 to 4 MHz. The VFO runs on the 'high side', so it must generate 3 + 6 = 9 MHz, to 4 + 6 = 10 MHz. The BFO crystal is on about 6 MHz. Now the second harmonic of the VFO (when tuned to receive 3 MHz) is 18 MHz, and the third harmonic of the BFO is 18 MHz, so we (may) get a growl type birdie right on 3 MHz band edge.

Do not choose an IF which is included in a wanted band, or forces adoption of a VFO or BFO frequency where these signals, or a harmonic, puts an internally generated carrier smack onto a wanted band. So spend some time and do the arithmetic, considering harmonics of both oscillators to at least the fifth, then choose IF, VFO frequency range and BFO for minimum in-band spurs. Nevertheless, some sort of compromise is generally necessary. Problems can be greatly avoided by using compartmented construction for the various oscillators. Naturally, the VFO should be housed in an RF tight box- preferably die-cast, in accord with current practice. If the BFO is also boxed up, then the likelihood of these sources "getting together" and producing unwanted products is greatly reduced. Even with a balanced mixer, and a good input filter, it is possible for very powerful signals to break through into the IF. Therefore, for instance, in some parts of this country, it would be prudent to avoid choosing 5 MHz as our IF.

Varactor diodes offer a way of obtaining the variable capacitance required for VFO and input filter circuits. However, their use significantly increases complexity, and great care is needed for a VFO application. A high quality potentiometer, preferably a multi-turn type, and well regulated and filtered voltage supply is mandatory. Provided their larger physical size is not a big consideration, ordinary variable capacitors allow us to keep things fairly simple, and understand more fully what's going on. The resourceful builder should not have great difficulty in obtaining suitable parts. There generally seems to be a number to choose from at the hamfests I have seen (see Parts). The main problem now is that of finding a really good dial and/or reduction drive. If you choose a round numbered IF, then a well shielded electronic counter can do duty by simply measuring the VFO frequency (those kHz digits to the right of decimal point), and perhaps applying the appropriate plus or minus correction factor, depending on BFO setting. Then a planetary or worm drive can do the gearing down. Quite reasonable resolution and reduction can be had with a conventional 6:1 planetary dial if you only need to tune say, 200 kHz. However, for a 1 MHz coverage (as a 'tunable IF' for example), a decent dial will be called for. One from an old BC-221 frequency meter is a fine example. As far as I know, there are no really adequate dials available 'off-the-shelf', although, once again, they do appear for sale at hamfests and white elephant sales.

It was probably Wes Hayward, W7ZOI who made popular the term "ugly construction". Also called point to point, rat's

nest, bunch of grapes... not very flattering names for a construction method that, with a little care and practice, can yield quite satisfactory results Even better, consider the "paddyboard" method. More than a few would-be builders have a sort of "no circuit board- no build" attitude, which is a pity, because more stable operation can usually be obtained in HF circuitry by adopting ugly or paddyboard styles, and construction time is considerably reduced. Furthermore, if something is wrong, or some improvement is to be added, then it is a simple matter of soldering in the necessary components. So, true experimenting is encouraged. With a circuit board, '"the die is cast" and any changes are difficult and messy.

IC's may be inserted into wire wrap sockets. The NE602 for instance, has pin 3 at ground- so leave that pin pointing straight down, and gently flair out the remaining 7 pins. Now pin 3 can be soldered direct to ground foil. Components which have one leg to ground are sufficient in number to provide anchor points for the remaining components. Try to keep it all on a low profile. FETs and transistors are sometimes better positioned up-side-down. The emitter resistor for instance, may well provide the first anchor, so clip one lead, and solder that end to foil using the unclipped lead as a 'handle'. High value resistors, say 4.7 megohm with one lead soldered to foil may be used where no actual circuit component is available. If there is a possibility of components shorting to foil, stick a little square of tape onto the board. The circuit can be quickly built up this way. Mechanical support for heavier components, such as toroidal coils, may be obtained if necessary, with double-sided tape, or a small blob of acid free silicone.

A toroidal coil hint; where the plan calls for, say 47 turns of # 26 B&S on an Amidon T50-2 core, estimate the length of wire required by adding up height and thickness of the core dimensions. For a T50-2 it is 5 + 3 + 5 + 3 = 16 mm, then multiply by the number of turns; 47 x 16 = 752mm. Let's make it 800 mm allowing for leads and errors. Uncoil about 400 mm from the spool and start looping them through. You may get 25 turns on. A quick mental estimation will now tell you where to cut the wire, and wind on the remaining turns.

For the VFO tank coil, avoid using toroidal cores, or any magnetic core for that matter. In addition to their unpredictable temperature characteristics, they have a nasty tendency to pick up stray 50 Hz flux form power transformers, and so 'FM' the VFO frequency. A plain solenoid coil on a bakelite, ceramic or PTFE former is

ideal. The coil should be placed at or near the centre of the VFO box, thus minimising coil losses and microphony effects.

For applications such oscillators and filters where stability and low loss is desired, use polystyrene, NP0 or silver mica fixed capacitors. Unmarked, unknown capacitors have no place in such circuits, and it is false economy to press them into service- think of the time you may waste trying to de-bug a wobbly (or won't start) oscillator. Buy new ones. Variable capacitors and trimmers should be air-dielectric- the ones with a plastic dielectric can be very drifty. Monolithic capacitors, typically 0.1 µF, do an excellent by-pass and coupling job, and are real space-savers. Take care when soldering- the leads may come adrift with too much heat. If you are working from a published design, try to use the components specified. If substitutions of so-called "equivalents" are made by you, be aware that the circuit may function differently from the original. The greatest problem areas in my experience are unsuitable core materials (slugs and toroids), capacitor substitutions, improper circuit layout, and instability caused by component crowding and attempts at trying to make the thing too small.

A 3 to 4 MHz/HF Receiver (no circuit)

The circuit is based on the Computarock (Ref 15), with some improvements. For receivers of more than one band, general practice is to cover a basic tuning range which includes a low frequency amateur band. To tune 1 to 2 MHz (1.8 MHz), however, would have at least three drawbacks; broadcast signals may 'break through' into this first IF, image rejection would not be especially good (particularly at higher frequencies), and rather large variable capacitors may be required to obtain satisfactory tracking. A first IF (or basic range) of say, 3 to 4 MHz is much more manageable; since there are fewer powerful signals to break through, the image is at least 2 x 3 MHz (6 MHz) away, and smaller variable capacitors are required.

This is not a "high-performance" design, and no claims are made in that regard. However, it is build-able by the amateur with the usual skills and tools, and provides, perhaps surprisingly- quite acceptable performance under all but the most hostile receiving conditions. On 3 to 4 MHz, and using the suggested converter, sensitivity is in the order of 0.2 uV for 10 dB S+N:N,IF (8 MHz) rejection is over 80 dB, and worst-case image rejection (28 MHz) is 50 dB. In accord with previous notes, a crystal filter IF of 8 MHz offers spur-free operation throughout the

3 to 4 MHz basic tuning range, and also greatly avoids spur production with round numbered computer crystals if a converter is used. A sure-fire Hartley VFO runs on the "high side"; 11 to 12 MHz. All bands are forward tuning, providing reception of USB/LSB SSB, DSB, CW and AM (as SSB).

Simpler superhets generally make use of the internal oscillator transistor within the '602. However, for the reasons stated above, VFO and BFO are separate boxed units with their own sets of components. This modest increase in complexity is justifiable in our pursuit of minimum spur production and satisfactory signal handling. Note that there is no IF amplifier. After the crystal filter, the signal is applied directly to the product detector.

A dual gate FET RF amplifier provides a useful degree of gain or attenuation of input signals. The source is raised to about 1.6 V by inserting an LED between source and ground. This amplifier is the only point where AGC may be easily applied, and it works pretty well. Detected audio is sampled at the output of the first '741 AF amplifier, and applied to the AGC amp., a favourite circuit which has been around for years. Although not 'full' AGC, quite a useful range is obtained, and ears are certainly saved with this set-up.

Construction

Sufficient details are provided here for the experienced builder to make their own version, or to adapt circuitry as desired. My set is housed in a home-made aluminium box measuring HWD 155 x 250 x 255 mm. Good compactness, rigidity and screening between stages is obtained with one horizontal and two vertical internal panels as shown. Yet all the circuitry is accessible during and after completion. Mixer, crystal filter, AF amplifier and AGC amplifier are accommodated upon one board in the right-hand compartment together with boxed BFO, converter in the left compartment, 3-4 MHz RF amplifier and VFO in the centre, and power supply below centre.

Here is where I cheat a bit, and say something along the lines of "in my junk-box I had...". Well, in this instance I did indeed have the necessary variable capacitors; a dual 100/100 pF unit, one of those superb English types with dual ball bearings and the shaft going right through, so that the VFO capacitor may be directly coupled at the end opposite the drive, and a

30 pF of the same make for the VFO. These types appear at hamfests from time to time. Look out for them, as they are very adaptable to individual requirements. Also, unlike most locally made BC type capacitors, you can arrange for clockwise shaft rotation to give a reasonably linear increase in frequency. If space permits, interpose an effective flexible coupler between the VFO capacitor shaft, and whatever is driving it. This will reduce drive wear due to any small shaft mis-alignment, and unwanted frequency changes being relayed to the VFO capacitor from hand pressure on the tuning knob.

A worthwhile improvement in stop-band attenuation may be had by building the crystal filter into a compartmented box, made from tin-plate, brass or similar. Start with one vertical partition which has a small hole near the middle, and solder it to the circuit board foil. Then crystal and capacitor, another vertical partition, and so on, thus avoiding any fiddliness in building the filter. When the five partitions and four crystals have been mounted, the longer side walls may then be attached. No need to use a lot of solder- small "tacks" will allow you to take it apart again if necessary.

The suggested converter circuit for coverage of the HF range is very similar to that originally used for the Computarock, and the reader is strongly advised to look up Ref. 15 for fuller details. The table shows those bands available using cheap computer crystals. Note that when a conversion crystal of 4 MHz is used to gain access to the 7 to 8 MHz band, we have the possibility of a spur that tracks 7 to 8 MHz; when the VFO is on 11 MHz (3 and 7 MHz) we have 11 - 4 = 7 MHz, and when the VFO is at 12 MHz (4 and 8 MHz) we get 12 - 4 = 8 MHz. My rough breadboard model did indeed have a faint constant tone right across this range, which had me worried at first. However, apart from the crystals at 4 MHz and 8 MHz, there is no other audible spur when the VFO and BFO are boxed as described, nor is there a serious problem with tuning 11 to 12 MHz- a busy SW broadcast band.

Alignment
For the basic receiver, verify VFO operation, and adjust so that a range of just less than 11, to just over 12 MHz is generated. Connect an antenna to the input (a few metres of hook-up wire will do for now). If there is a TV set, or video recorder operating nearby, you should hear a burble about every 15 kHz across the band. Adjust the 55 pF trim capacitors at the input filter for as flat a response as possible. Depending on circuit vagaries, some compromise in response may be necessary. Counter-

clockwise (CCW) rotation of the RF gain pot should cause the S meter to deflect up to full-scale. Adjust the 100 ohm meter sensitivity trim pot for f.s. deflection at the CCW position of the RF gain pot, then return the RF gain pot CW to max. Set the 500k AGC pot to maximum. Tune in a strong signal- which should cause the meter to deflect upwards. Adjust the 500k AGC pot for what you regard as satisfactory AGC action (probably some point near maximum). The receiver should be responsive to strong and weak signals, which should sound clean, without hum, fuzziness or distortion.

Check that USB and LSB reception is possible. Crystals vary somewhat. The 7.5 µH coil for LSB is an average value found after trying several different makes of BFO crystal. However, if you find that LSB SSB signals sound too "woolly", more series inductance is required to move the BFO frequency further away from the filter band-pass. Experimentally add some five or eight turns to the coil, and check again. If LSB SSB sounds "tinny", then less inductance is required. No adjustment is available for USB- using the crystal "straight" puts it on about the right spot at the other end of the filter. However, the crystal can be pulled quite a lot higher in frequency by inserting the appropriate amount of series trim C, so keep that idea up your sleeve if required. As a final check, tune across a Morse or RTTY signal; you should get a strong note one side of the signal, then as you tune through to the other side, the note should be much weaker. Changing to the opposite sideband should reverse the strength of the notes. Also, the character of the background hiss (no signal present) should sound about the same when switched to either sideband.

Parts

I don't know about other cities, but here near Melbourne, in addition to the usual components retailers, we have three or four vendors of radio type items. Variable capacitors, trim caps, Amidon cores, NE602's and many other parts are available from Electronic Disposals (03) 723 2699, Daycom Communications (03) 543 6444, and Stewart Electronics, (03) 543 3733. Resurrection Radio (03) 529 5639 sometimes have good used variable capacitors. The Moorabbin Radio Club, Ballarat and Bendigo hamfests, and EMDRC white elephants are always good sources of parts. Two USA mail-order suppliers; Ocean State Electronics, and Antique Electronic Supply (see ads in QST) are, in my experience, reliable sources of radio components, including variable capacitors. Sheet aluminium may be bought at reasonable prices from Alcan outlets (check their off-cut bin- sometimes cheaper). Finally, Rod Irving Electronics and Tecs sell a good cheap

range of computer crystals (usual disclaimer).

I have successfully used a VCO from a scrapped cel-tel - this one went to 900MHz ok.. Directly modulated VCO through low gain video amp for better control. MMICs and a small brick take it to a few watts. Have used bricks designed for 800 MHz, but input matching got weird. Selecting the proper length of RG-188 to drive it was necessary to achieve output. Wrong length = no output!

For rx, I run my (conventional) downconvertor into an old satTV (LNA style) box which normally used a 70 MHz IF. ...Got it free from a friend who had installed an LNB system - was gathering dust in basement. Has ch3 and baseband video output.

The video quality is great and don't have to worry about linearity! It is built into the tape basket area of a mechanically damaged camcorder I got for $20. Too bad those are so hard to obtain... Transport/basket most failure prone area of camcorder - who cares!? Most places won't give/sell defective units. Several large store service areas checked said- yeah got a nice one with beyond repair basket, but you can't have it... Policy sez we gotta destroy it! :-(

??? Can anyone tell me what the LNA rx boxes want to see for audio modulation??? Currently I am not applying audio to the tx system but would like to...

Also... Have HBed several hetrodyne Tx for 426. Excellent audio, fair video pix. Had to start with a ch3/4 "modulator" from VCR which was a little limiting. Never could find the National chip I wanted to use (I think the AEA xcvr did use it). .. Mine was on the air when ARA started selling their (similar) rig.

We have a 426 in 923 out AM repeater on mountain top here also.

I just downloaded HamCom 2.0 and need some clarification on the converter schematic. The Bridge circuit to the right of the Op Amp is confusing. I don't know which nodes are connections or not. Does anyone have a better copy or can clarify this part of the circuit?

Also, do I need the PTT input if I'm just going to hook it up to my DX-390 to decode RTTY? What's it for anyway?

: Bruce
: N6URH

Thanks for the comments, Bruce. I thought my windings were spread out,
but I will experiment with that factor.

I used two different capacitors (and different frequencies, of course);
a 150pf ceramic, and a 1500pf polystyrene. I checked both values with a
bridge. The signal generator output is < 1 volt, so there's no high-current
situation.

It is interesting that the higher-permeability core had the least deviation.
I intended to build a bandpass filter, so I need a little better than
100% error on the iron powder cores. Does anyone know if Amidon is still

around?

I guess you're talking about the Rohm Ba1404. It's a stereo multiplex generator plus an FM oscillator; you can build a stereo FM transmitter with just this one IC and some parts. But follow the Rohm spec sheet exactly unless you know what you're doing -- it's important to preserve the phase angles and duty cycles in the multiplex circuit. Even the designers of one popular FM stereo transmitter kit goofed up the design for their unit because they didn't know what they were doing. The one problem with this unit -- FM carrier instability and drift. It's really best to use the BA1404 to generate the subcarrier, pilot tone etc., and then use a separate FM transmitter (frequecy controlled) for the carrier.

John -

I've used the Amidon T-37-6 extensively in a homebrew transceiver, and in transverters. I haven't made measurements as you mention, but I always have to remove turns to obtain resonance, in a BPF, for example. To match your 2X measurements, I would have had to remove 30% of the turns. Don't think it was quite that much, but I had trimmer caps to compensate.

When I do measure coils or caps with SG/Scope as you mention, I always use 1k, or even 10k, on both sides. The scope probe has some capacity.

>That's why the network transforms impedance and has selectivity.

Well, you lost me here, so let me ask two questions. When the
network is terminated in a 50 ohm resistive load and tuned to
resonance, will it present a resistive load to the tube?

Also, if the network presents a resistive load to the tube,
will the the power factor at the input to the Pi be unity?

>Looking at the ends of the network doesn't describe what is
>going on in the center at all.

What I'm looking at are the two ends of the inductor. To me,
they appear to be the same two physical points as the ends of
the network. Because of this, I'm having a little difficulty
distinguishing between the center of the network and the center
of the inductor. You've said they're not the same, so can you
please tell me exactly what point in a Pi network you're
referring to when you say "center of the network"?

Also, I'm curious about the role of circulating current in this
situation. The Amidon formula only requires that we know the
RMS voltage across the inductor in order to calculate flux
density. Given that fact, why would (for instance) 100 V RMS
across the inductor cause greater flux density when the coil is
in a Pi network, than the same 100 V in any other situation? If
the voltage impressed on the coil is the same, I don't understand
how more or less current can flow through the winding. Is it
possible you're saying (in effect) that the voltage I've
calculated across the coil, based on the operating impedance of
the tube and the output of the amplifier, does not reflect the

RMS voltage that's actually present?

Incidentally, I found a circuit like this in the '78 Handbook. It's a 160M transverter with a pair of 6146's and it uses a T-200-2 toroid core as the basis of the Pi network inductor. I calculated the flux density using the same technique as in my post, but with the parameters of this specific circuit. The results agreed with the construction of the toroid shown in the article, that is, a T-200 core appeared to be the appropriate size for the amplifier.

I'm not about to use that example as evidence that my procedure is correct, particularly given your disagreement with it. However, I would like to have a better understanding of exactly what it is you're pointing to as the problem with my approach.

I doubt that these techniques would improve reception as much
as they improve transmission. Modern SW receivers do not depend
as much on maximum power transfer as they do on S/N ratio. I'm
assuming you are asking about receiving rather than transmitting.

Info is available from TLCdhconsult@delphi.com. They are publishing
my application notes but I am not monitarily involved with them.

>AN EMPIRICAL APPROACH TO BUILDING AN HF RECEIVER

<<snip>>

>For applications such oscillators and filters where
>stability and low loss is desired, use polystyrene,
>NP0 or silver mica fixed capacitors.

It's been my experience that this is not particularly
good advice.

Silver mica capacitors are very unpredictable regarding
their temperature coefficient. They may be either positive
or negative, and may even exhibit a rate change or outright
reversal of the coefficient as various temperature thresholds
are reached. Stable units can be hand-picked if one has the
time and patience, but even these may exhibit a change in
temperature coefficient with age.

It has been suggested elsewhere that the negative temperature
coefficient of polystyrene capacitors will offset the
positive coefficient of oscillator inductors, resulting in a
stable circuit. However, I have found that their negative
coefficient (which varies from cap to cap) may simply
overcompensate the coil, resulting in significant drift in
the reverse direction. This is particularly true if a good
quality inductor is used. These capacitors are extremely
stable with age, but they are expensive and values above
100 pf or so can cost more than $3 each.

Quality NPO (COG) disc capacitors exhibit a coefficient
close to zero and their aging characteristics are suitable
for all types of amateur VFO work. In addition, they are
much less expensive than the previously mentioned types.

It is my suggestion that any new VFO first be built solely
using NPO discs. The capacitance should be divided among
various value capacitors. If drift is excessive, then and
only then should polystyrene caps be used in the circuit.
In this way, a negative coefficient can substituted for the
NPO capacitors gradually, and the process will be much less
frustrating. Alternately, if one can locate a differential
variable capacitor that will fit in the VFO compartment,
the differential and a N2200 disc can be used in place of
the polystyrene, and the differential capacitor adjusted

for zero drift.

I am also experimenting with monolythic capacitors as replacements for NPO discs, but I'm concerned about their dielectric stability. Does anyone know if the characteristics of these capacitors is likely to change significantly with age?

This is explained by the fact that the capacitance of your test setup is a lower percentage of overall capacitance with that particular inductor/capacitor combination.

You need looser coupling to the circuit under test for the measurements to be valid. Again, a GDO is one of the best ways to do this.

Mark, it definitely isn't necessary and I don't think you would
see any improvement whatsoever.

The difference between the need to do this on transmit VS receive
has to do with the fact that in transmit, we are generating RF
that can cause problems if it doesn't go where we want it to.

For receive only, you would do just as well to feed the non-
resonant antenna with coax and use an inexpensive L/C tuner ahead
of the receiver. Even at that, the difference may not be
significant.

The lower part of that range also matches the kicks to your seat from the infant riding in his mother's lap in the seat behind you on the 6-hour flight from Pittsburgh to LA. Luckily though, his constant screams are usually well above that frequency. :-[

>I also think noise in that subaudible range causes nausea in
>some humans...

Also fatigue. I read an article a number of years ago in which the author speculated that automobiles can cause false motion sickness and/or driver fatigue. The theory was that as the car travels on uneven road surfaces, chassis/body flex would create subsonic pressure changes in the interior. The author also suggested that the effect is most pronounced in poorly designed unibody models.

Should be easy, and the commercial synch detectors that I have by Sony for the SW100 and 2010 are fine, but the offering with the Grundig Satellit - supposedly top of the range - goes to show just what a mess can be made of the project. Even by 'experts'. ;-)
The poor audio, howls, rumbles and rotten sideband suppression make the option barely worth using. Add to that the necessity to use MGC with it, and it's a dog!

BTW, I note that the new ICOM tabletop - I guess to supplant the venerable R71A (yes, I still love it) - seems to come without a synch detector. Is this intentional? Have I missed something? Maybe Icom has missed something?

You can also use a circuit like the Plessey 624/1624 which uses a limiting amplifier rather than a phase lock loop to generate a local carrier. I build the simple circuit from the Plessey 624 application note, which I feed with the 100 Khz. IF from my Racal RA-17, then into a separate audio amplifier Total cost under $10. Very good audio with a bit of bass boost which makes for pleasant listening.

3694. Want to use optocoupler as RF tranformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-07 00:00:00 UTC
From: vesta@stout.entertain.com
Message-ID: <4pb074$cv9@stout.entertain.com>
Source record: 104740

(The following are solely my own opinions and not those of my employer - Andrew Jonathan Fine - WA2JAZ)

TWIMC,

I've been wanting to experiment with direct conversion receiver circuits, and I had the possible idea, maybe a crazy one, that perhaps an optocoupler (eg... a chip with a photodiode on one side, and a photodarlington on the other) of today's technology could pass a 1.8 to 4.0 Mhz small RF signal.

I recently read of an EDN article that used an Op amp on one side of an optocoupler to expand the usable bandwidth from kilohertz to submegahertz. I was wondering if the circuit experts out there would be willing to render thier opinion on using standard bipolar or fet amplifiers to expand the usable bandwidth of an optocoupler into low RF.

I think the big advantages of using an optocoupler rather than a transformer for interstage coupling would be as follows:

1) The diode side could be used as part of the product detector, with the darlington side getting the rectified AF signal emitted as light from the diode.

2) It might increase the stability of a VFO circuit if used as coupling between the VFO and mixer.

3) Circuit might be less sensitive to stray inductances since we cut down on wire transformers, because we are using "photonic transformers" instead.

Opinions?

Thanks in advance!

Hi,
After you have your licensed stations on both ends. You have to decide what your going to do with the 'other' computer. Are you just experimenting with remote control or do you expect to have a tightly coupled network? If your just 'trying it' and both machines are DOS based, the old little known CTTY command might be a way to talk to the other system. They both are at a DOS level, and the remote system becomes controlled by the local console. This is the simplest 'two wire' path. You could build a NULL modem cable and try it out with two systems side by side. Then just think of two packet controllers as modems (they really are). I think AX.25 mode will let you link the 'hardware level' I'm no packet guru, or any other for that matter.
If you can get that to play, you might attempt something like KopyKat (Warp) or PC Anywhere (DOS) to perform advanced control functions. File networking is going to require a NOS (Networking Operating System) like JNOS, Warp Connect Peer to Peer, etc.

Is it possible that this schematic might have been in the 'Specialized
Communications" publication??? I didn't find it in the 1969 or 1976 editions.

>My point, that I may not have made well because I didn't want to
>get lengthy, was that things aren't as simple as the dc anode
>voltage and current as related to the load voltage and current.

Let me summarize what you've said, just to be sure I understand it.

1. The method I used to determine core size is correct, but
certain operating conditions have to be met.

2. One of the conditions is that the network must be tuned
to resonance. If the network isn't resonant, the voltage
across the coil can be almost any value.

3. Another condition is that the network must be adjusted so
that the tube is properly loaded. If it is set so that
there is excessive loading capacitance (too lightly loaded),
anode RF voltage will be higher than is provided for in the
calculations.

4. Significant voltage phase shift may occur across the coil.
Adding the input voltage to the output voltage (representing
a 180 degree shift) will provide a worse-case number when
calculating flux density.

Incidentally, I have discovered that this is intended to be used
in a converted CB amplifier, and that the plan is to convert the
amp to 40 meters only. There apparently isn't room for either an
air-core coil or multiple toroids.

One other thought on all this. The operating impedance of this
amplifier is about 1,200 ohms. If a 4:1 and a 6:1 transformer
were used in series, the operating impedance would be transformed
to 50 ohms. Then, external filters could be used. This has the
disadvantage of requiring the filters, but it would result in a
broadband amplifier. What do you think about this idea as a way
of getting multiband use from the amplifier?

The microwave oven supplies I've seen have usually been half-wave voltage
doublers. The
HV transformer would probably give you what you need if you used it with a
conventional
full-wave bridge & filter circuit.

The "bridge" is a circuit that will always reroute the good polarities
from DTR and RTS to the op-amp to have pin7 +Vcc and pin4 -Vcc. This was
added because on some computers DTR and RTS may flip to reverse polarities
during power-up (boot) and that could damage the Op-AMp

Hi Jack,

In article <4p8p33$9pl@crash.microserve.net>,
jackl@pinetree.microserve.com (WB3U) writes:

>2. One of the conditions is that the network must be tuned
> to resonance. If the network isn't resonant, the voltage
> across the coil can be almost any value.

Not resonance, but rather to a conjugate match or slightly overcoupled.
When the load is miscoupled to the source, the voltage in the tank can get
pretty wild. If the circuit isn't resonant, nothing much goes on. The
output device just gets hot.

>3. Another condition is that the network must be adjusted so
> that the tube is properly loaded. If it is set so that
> there is excessive loading capacitance (too lightly loaded),

A whole bunch more, I've measured as much as ten times more in test
circuits.

>Incidentally, I have discovered that this is intended to be used
>in a converted CB amplifier, and that the plan is to convert the
>amp to 40 meters only. There apparently isn't room for either an
>air-core coil or multiple toroids.

Yuk. I hope the thing has decent support circuitry. Most CB amps are
absolute trash for IMD. I'd pay a lot of attention to the rest of the
circuit also.

>One other thought on all this. The operating impedance of this
>amplifier is about 1,200 ohms. If a 4:1 and a 6:1 transformer
>were used in series, the operating impedance would be transformed
>to 50 ohms. Then, external filters could be used. This has the
>disadvantage of requiring the filters, but it would result in a
>broadband amplifier. What do you think about this idea as a way
>of getting multiband use from the amplifier?

The anode waveform is a pretty rough series of pulses. Remember how the PA
works, the tube is a time varying resistance that gives the tank a little
pull in one direction only. The tank has to wheel around to smooth stuff
out, and then the tube gives another tug at the correct time again.
(Unless it's class A or push pull.)

I'm afraid the transformers would have a tough life, being in the middle of all this tugging and flywheeling, hi.

It's tough to build a good 1200 ohm to 50 ohm transformer network for a sine wave signal on one band, let alone a signal that contans many high order harmonics and covers many bands.

Even with a sine wave, the anode output reactance and other strays would kill the system on ten meters. It's certainly not as efficient as a simple pi-network, nor very practical.

The closest thing to the system you described was a Central Electronics amp that used low Q link coupled networks. That was before the days of FCC type acceptance that required good harmonic suppression.

I'd stay with the pi, and make sure thee thing was a clean design.

Hi,
Cablewave Systems makes an end connector P/N 16733 that gets you from
1/2" aluminum CATV hardline to an 'N' connector. I'd bet they have what your
looking for. Sorry, no address on Cablewave. I use them to terminate a 175'
run betwixt the 4-1K and my tower. Works slick...

I don't want to quote the original so in summary the idea is
to use an old defective VCR for receiver parts.

I have salvaged a couple of these for parts and some of them have
a module that is the complete receiver, RF to video and audio.

This only works for a VCR that has a "cable ready" tuner.

See if those stores that insist on destroying them will let you
check for the module, if so, help them destroy them by removing the
module. Get the connection info at the same time.

They work great for reception of 435 MHz AM transmission.

The three microwave ovens I've dismantled all yielded a transformer with approximately a 2100 volt CT secondary. With a full-wave rectifier (CT grounded), this will give somewhere around 1500 V, and around 2800 V with a full-wave bridge (CT unused).

It is certainly well worth getting a junked microwave for parts and experimentation. They yield up a lot of nice switches, even if everything else is dead.

Source record: 104828

Many years ago I got some HT-transformers used in
Philips/Whirlpool microwave ovens and wanted to use one with a
linear amp. They were 2100 V AC-units with a low voltage filament
winding.
With just a bridge rectifier the DC output held up well under
load but when I added a capacitor the DC voltage dropped
dramatically when I loaded it so eventually I discarded the
transformers.
Obviously the peak current through the capacitor made the core
saturate, perhaps intentionally as a built-in magnetron flashover
protection.
I noticed that the laminated core had been welded in a couple of
strings. Normally the laminations are isolated from each
other with a coating of varnish. Could that be the explanation?

Hi Nick,

If you're looking for a TNC, any of the current models will work. The conventional RS232 on the TNC is 99% compatible with the Mac's RS422 serial ports. You just need to either make a cable, or buy one for between $5 and $15 from any computer store or MacWarehouse etc. Right now I'm on a Powerbook 160, that's hooked to a PPP Internet connection and the local Packet system via a TAPR TNC-2. You can either pick up a used TNC at a hamfest, or buy one from HRO (http://www.hamradio.com/) or AES (1-800-558-0411). You might also find a kit somewhere, but I don't know about those.

Good luck, and happy packeting.

Quite true! I can't count how many dead VCRs I have gutted for ATV parts....
I forget the exact ch, guys, but 70cm ATV is about ch 60 - 68. Have known
some who used a retuned downconverter to dump into the if section if the
front end or synth. is fried. On one older varactor (non cable ready) unit
I opened the LO section and added a bit more inductance to tune down from ch 15.
This can be a bit tedious!

I have also built a GASFET / double tuned pcb stripline filter / MMIC front
end. This can be antennna mounted and really "wakes up" (and adds selecectivity)
the cable ready VCR for ATV.

John,

I missed the start of this, but I've wound at least a hundred different
toroids and measured them on good lab equipment. Perhaps I can contribute
some info?

You shouldn't get 100% variation, but 10% is reasonable. You can't wind
any coil to precise value (air core, iron powder, slug tuned, what ever)
without manually setting it on value. As Bruce said, distribute the turns
over the entire perimeter of the toroid to minimize distributed C. My own
experience has always been that you should subtract 1 turn from the
calculated value for moderately sized inductors (> a few hundred nano-
henries) and you'll end up taking off more turns if you're trying to set a
sub 100 nH coil on value at >70 MHz.

BTW, Amidon just distributed core forms from Micrometals (iron powder)
and Fair Rite (I think - for the ferrite cores). I've heard they're gone,
but don't know for sure. I have the micrometals cores books (Q curves and
all) if you have questions.

73,
Bob

I'm going to attempt to modify N6GN's 2 Mbps microwave data link to operate at 10 Mbps. Unfortunately, I don't know where to find a pair of Gunnplexers with electronic tuning (like the M/A-COM units) like he suggests to use. If anyone could help me or has some they would like to sell, please drop me an email. Thanks.

Greetings,

QST published some info on the 2510 but I'm looking for 2600 stuff.
The QST article specifically stated the mods apply to the 2510 not the
2600. Purchased the unit second hand so I do not have any docs
(schematics) yet.

Thanks

Dave

Monolithic capacitors are very widely used in industry, including by test equipment manufacturers who are very sensitive to reliability issues. I used monolithic NP0 capacitors in the oscillator of my little "Optimized" transceiver built about 1979, and several other rigs built since then. If any of the oscillators drift more than when they were built, the change hasn't been enough to notice.

Amidon is, or was, a reseller -- they don't manufacture cores. Unless
something has changed in the past several years, the powdered iron cores
they sell are manufactured by Micrometals; the ferrite cores by Fair-Rite.
They've always used the part numbering scheme of these two manufacturers.

I'm trying to throw together a little backup power system that would be capable of running a small TV and maybe a couple of light bulbs. I have a little "RECOTON" 220 Watts inverter (12 vdc to 110 Volts AC). I also have a couple of 5 AMP 13.8 VDC power supplies. I was thinking about buying a deep cycle 12 volt battery and combining these components to make a little system that will keep the house lit up and the TV on during Santo Domingo's frequent blackouts.

Can anyone suggest an easy way in which I can work out a charging arrangement for the battery? It doesn't have to be automatic - we could manually shut off the charging voltage.

Will this system work? Any suggestions would be much appreciated.

I have bought cores from Amidon just in the past week, and a 1995 edition
of their detailed manual, so they seem to be very much in business. Does
someone believe they are on the way out of business?

Thanks to everybody who replied...

I found a motorola IC MC1330P which is used for video detection, it appears to be some kind of limiter/product detector. I tried a lash up using a 455khz ceramic resonator used from an FM discriminator circuit and it seemed to work well on the bench signal generator.

Next step is to try it on moy home-brew RX.....

Message-ID: <31B9B32D.3BEB@limestone.kosone.com>
Source record: 104758

I'm wondering if anyone has any info on the following radio:

Manufacturer Pye Electronics
Model G-F60 FM.V (It's hard to read the "G", may be something
else.)
Power 110V Power Input
Type 294561/1
DOT Approval 104264119

This is a fairly old (but seems to be all solid state) unit that was
purchased at a charity auction about a year ago. Any information
(original use, frequency, power, etc) would be appreciated.

Thanks.

If manual switching is OK, I would use an inexpensive trickle
charger designed for automotive use. If the outages are so
frequent that a faster rate of charge is required, there are
larger models that can be left connected all the time (except
perhaps when the power dies).

Source record: 104760
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Does anyone know of a design for a simple broadband radar
detector?

I would like to pick up pulse radars between 2 GHz and 10 GHz at
approximately 5 miles. I think the best design might be a
crystal video receiver with a cavity backed spiral antenna
(archimedean or equi-angular).

The design of the antenna would act as a broadband pass filter.
But I am not sure how to match the antenna to the detector or
how to bias the detector to improve its performance.

Can anyone help, or know of a good book?

Regards

I have a similar set up for my aquarium pumps, a 300watt inverter, two deep cycle marine batteries in parallel, and a regular "automatic" automobile battery charger to keep the batteries charged.

You can do all the switching with a 110 vac coil 3 pole change over power relay, I used the 11pin "octal style" plug in type.

The coil is energised from the 110v line. Two of the poles change over the pumps from the line to the inverter output, the 3rd pole is wired across the inverter on/off switch (which in all the consumer type inverters I've played with carries only low current, not the inverter supply current) to turn the inverter on when the line fails.

The charger is just connected permanently to the batteries and is the type that drops automatically to trickle charge once the batts reach a certain voltage.

A friend of mine has a cabin set up to run completely on 12 vdc. The lights are 12 bulbs used in automotive trouble lights and all of his "neccessary" equipment is all 12 vdc as well. Then you don't have to worry about running the batteries down as fast, OR burning up an inverter. He has a car alternator on an old push mower deck that he takes with him every now & then to charge the battery system.

Just using 12vdc instead of 12vdc to 110 AC is a lot easier on the pocket as well.

Hope this helps.

Door opener/alarm Gunn sources are easy to find but to FM modulate
them you have to vary the Gunn voltage. 10 MBS should be easy to do
and the equipment is cheep. I don't have QST at hand so can't quote
but there should be advertisement for the units you asked about.

For Sale

MFJ 1276 Packet/Pactor Controller

Operates HF/VHF Packet and Pactor
Recieves FAX with optional MFJ software
Built in memeory expansion socket
Expanded 32k Mailbox - expandable to 512k
64K battery backed up RAM
20 LED Precision Tuning Indicator
TAPR TNC-2 compatible
KISS interface for TCP/IP, MSYS Compatible
Upgradable to 9600 for $103
Selectable 19,2k DTE
Side tone amplifier and volume control
RS-232 and TTL serial ports
HF/VHF Select Switch
AC adaptor and Manuals
It is in pefect, like new condition.
It is in original box and packing material.
Works and looks perfect.

Price $120.00 plus shipping

I think you can still get the M/A-Com units from Advanced Receiver
research. They are a bit costly though.

I believe someone suggested the gunn units used in motion detectors.
I would shy away from these in a 10Mb application. Directly modulating
a Gunn diode barely results in good video for my ATV applications.
High speed data would be even more demanding.

Steve Muther WF6R

3741. biased diode, almost no effect??

Newsgroup: rec.radio.amateur.homebrew

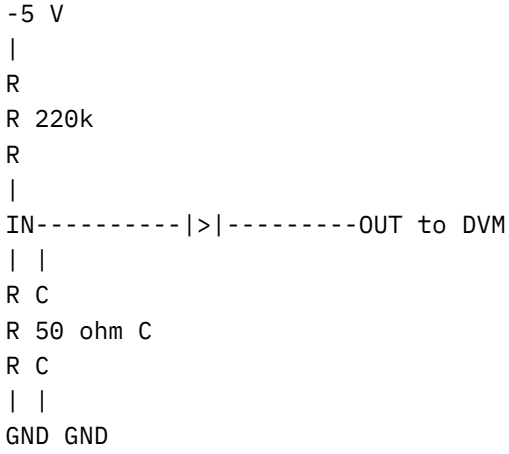
Hi,
In Dubus technik III there is an article about an automatic power/ VSWR meter. This meter works with a directional coupler from EME. This coupler has a good directivity. To benefit from that, the diodes connected to the pick-up lines should have a large useable range. The article states that with the diodes used without any bias current, they are only linear over a 12 to 30 dBm range. with 20 uA bias current though, they should be linear from -5 to 30 dBm.
Now I have been using a simple milliwatt meter with a single 0-25 mW range for quite a while and would like to build something more fancy. I thought the idea of such a biassed diode would be nice because with such a large linear range I could use the same scale for the 10 100 and 1000 mW ranges (and a second one for 30 300 mW).
Anyway, the article doesn't specify what diodes are used, since they are supplied with the coupler. So I make a little test setup to try a few diodes and see what they behave like.
And here (at last) I come to the point of my question. I didn't get much improvement at all! In the range 0 to +20 dBm I could only see a improvement of 1 dB at a 10 dBm level and 1.5 dB at 0 dBm. According to the graph in the article I would expect 2 and 8 dB at the mentionned levels.
I have tried 2 Schottky diodes 1SS99 and BA481 and a silicon 1N4148 for comparisment purpose. Tha graph says to be for Schottky diodes. Why do my biassed diodes not improve? I have tried various bias currents in the 10 - 100 uA range.

This is the test setup:



With the bias voltage below 0 the current flows from ground though 50 ohm, diode, 220k to -5 point.

At OUT I measure a negative voltage of 70 - 210 mV depending on diode
and bias current, plus the rectified voltage of the input signal.

Any comments are welcome, I don't see where I go wrong here.

Thanks and 73,

>

John;

FACTS:

QRZ added 32 New Programs in the June 1996 Issue
AmSoft added 108 New Programs in the June 1996 Issue

QRZ June 1996 has a corrupted file "tfhpn101.zip"
AmSoft tests all its files.

QRZ June 1996 has published damaged data in the call sign data
Check out KC8CSF, KC8CYB,KF4GSM, & N3XGK on your QRZ!
These people were all born on 12/31/99? and got a ticket on 12/31/99??
AmSoft notified the FCC of these flaws on April 22. The FCC fixed them.
It may be a surprise to you, but SAM, BUCKMASTER, & AMSOFT all fixed
the call sign errors before publication this spring , QRZ did not....

So go ahead an spend your $12.95 or the $9.40 they were selling for at Dayton!
You only get what you pay for.....

BTW I also use the flying horse CD and like it.

I've designed the audio amplifier in my direct conversion receivers to have a 50 ohm input, so no transformer or other matching is required between it and the diode-ring mixer.

A critical characteristic of DC receivers is immunity from AM demodulation. This requires good mixer balance and stong signal-handling capability. If your method sacrifices these, I'd say that the trade is a poor one.

Ah yes, AT&T WaveLan 900 and products like the Percom Wireless Bridge do work wonders, 'tis true. One problem with amateur products like this is that most if not all of these spread-spectrum LAN cards use spreading methods and/or sequences that we amateurs are forbidden by FCC regulation from using.

How about simply putting a high performance antenna on an automotive radar detector? Since the advent of laser speed detectors, the older models are available for next to nothing (I'll sell you mine really cheap!). There was a '73' magazine article on modifying them to act as a front-end for a microwave receiver a few years back.

In an April issue of Radio Electronics some years back (3 or more)
there was an article on building a "Gravity Wave Detector" or something
to that effect. It was supposed to be an "April Fools" joke, but it
turned out that the way they'd layed it out and the length of the leads
on a capacitor on the input of a high-gain op-amp circuit were just the
thing to detect radar-band signals! So the joke was on them.

Direct FM of the gunn osc is only good for a couple of mega-bits. The
motion detectors can be modified for electronic tuning by placing a
varactor into the gunn osc cavity. This is tricky, but if done
carefully, can save several hundred $$$. The varactor isn't critial, a
garden variety 1N914 can even be used. The trick is getting the varactor
into the cavity while not allowing any microwave energy out -- *and*
the feedthru must allow several MHz of bandwidth, so a garden variety
feedthru cap isn't the best choice. Fortunately, it doesn't take too
much LC to attenuate 10GHz.

Yes, that was an obvious fix. The limitation is the limited mod. index
you can acheive by modulating a Gunn directly. That, in combination
with the simultanious AM and FM modulation which results makes a
real mess out of your digital modulation (and in my case video).

Message-ID: <4phsj4$3ai@murrow.corp.sgi.com>
Source record: 104689

Gang,

I realize that this is not totally homebrew, but some consider doing a kit as homebrew, so I thought that I would just post all the facts and let them fall where they may. :-)

Idiom Press, Box 1025, Geyserville, CA 95441

CMOS II listed as $48 US, $50 DX postage paid

CMOS III listed as $58 US, $60 DX postage paid

MO or check, no plastic, i.e. credit cards.

I have both. I'd personally recommend you go ahead and spend the extra ten bucks. IMHO.

The newer model is smaller and has more memory and can be powered off and come back in same state.

I have a new WBL Designs Iambic Paddle designed and sold by W9WBL, Stan Hails Jr, 6345 Coffman Road, Indianapolis, IN 46268-2591 (800) 726-8936 for orders M/C es Visa, no CODs. Iambic Model V2L sells for $105 pp US. For non-US hams or non-order calls (317) 291-1738 9-5 EST/EDT. Stamp to Stan will get you a flyer.

The reason I bring this up is that it is the best iambic paddle that I own and I have them all but the Mercury. Didn't intend to wind up collecting iambic paddles but I did. IHMO the V2L is the best. It allows me to go 50wpm now whereas before the best I could do sending was about 40 to 45 depending upon the paddle and some worse than that.

The V2L has room in the back for the CMOS III but not the CMOS II as the II has a wider PC board. This in case you don't have one rig you want to mount the keyer into.

I got the paddle at Dayton. Another favorite before this paddle is the Brass Racer Square Base Serial #1, not the one stolen at Dayton before someone goes ballistic. I gave Mitch the idea for the square base and beat on him at Dayton and HamCom last year. :-) Actually pestered him into it. This one I use mobile CW and in the field. I also have the prototype also. .jpg files under

ftp.lehigh.edu:/pub/listserv/qrp-l/pictures/keys and
available through anonymous ftp.

environ1.jpg - Envirotronic paddle, $64.95
environ2.jpg - "" on GM-40 manual next to kit
march.jpg - Mike March paddle, see Dave Ingram's articles $150
mcelroy.jpg - McElroy teardrop straight key next to J-38
racer.jpg - Brass Racer Sq. base # 100901 and numbers changed later
spain.jpg - Made in Spain paddles, email for details as
I have to look it up
viambic.jpg - Vibroplex dual paddle with grey base

Someone want to put these on a web site, be my guest. I did
'em and I have plenty more. :-) If they are too big I can
rescan to 432x288 tiff format for the PC world viewers. I'll
take a picture of the WBL design and store tomorrow. It is different.
Email me for a review writeup I did on QRP-L if interested in details.

OK, now homebrew question. Anyone know of anybody else like Gene Thoma,
N0LSS, and Mike March who mfg's paddles on the side or as a hobby?
They do some nice work and these are usually works of both art and
love for CW. IHMO good buys each and everyone. Budgetary constraints
aside.....

This posting FYI and I don't get anything for the review(s) nor discounts nor
freebies nor ..... Just a satisfied customer.

By the way you worded that, you make it sound as if 91X is breaking the
law. Just in case you don't understand this, let me clarify. 91X (XTRA
91.1) is a broadcast station located in Tiajuana, Mexico. They are subject
to, and abide by the Mexican equivalant of the FCC. Our FCC only has
juristiction over US broadcast stations.
They are allowed to use 100,000 Watts (100KW, and they use it), and are
also allowed to direct that radiation, which is generally not allowed with
FM broadcast here in the US. They direct most of there raiadtion north,
towards the US. (For others that aren't from around here, their format is
80s and 90s alternitive rock, and the DJs speak english. There only
requirement is they have to play 1 hour of Mexican government programming
on Sunday night -in spanish)
It is not unreasonable to hear 91X in LA. When I used to listen to them, I
could hear them all the way into Hollywood (200 miles) and have heard them
as far as Death Valley (400 Miles).
>

102.1 is located in Oceanside and only has a 10KW transmitter and an
omnidirectional antenna. That is all their license allows, so their
coverage isn't nearly as good as 91X.

>
> Finally, there's one more station (100.3 I think) which is KBAY I think

>
There's no magic number, but the main factors such as Altitude of the
transmitter and reciever, radiated power, terrain inbetween Tx and Rx.
You not hearing any kind of skip or tropospheric ducting on FM. The trip
to Santa Barbara for 91X is easy becuase it's over the water and there is
nothing to block the signal. The trip for KBAY may be helped out by
[insert proper name here] ducting where the water evaporating creates a
path for the radio wave. It's kind of like fiber optics where there are
different densities of medium and the wave always wants to bend (refract)
towards the center, or in this case, just above the water.

> Please let me know if this should be re-posted elsewhere or if I should

> -Allan
> allan@carhart.com
>
> (1) assuming average weather conditions --probably more sunny days than cloudy
> ones in North and South California

Someome may correct me on this, but I don't think weather has much effect
at these frequencies.

> (2) assuming the radio station is within the FCC limits but at the high end

The US FCC issues licenses of different power these days. Some old
stations that have been on the air for 30 years have 50KW transmitters,
but newer commercial stations are getting licsenses for as little as 5KW.

> (3) boom box with analog tuner and/or high-end walkman with digital tuner
> and/or car radio with digital tuner

Antenna is the major factor here. Your car would probably have the best of
any of your examples.

> (4) I would assume that 91x (91.1) doesn't exceed federal limitations
> by too much due to either financial limitations or Mexicon Government limits.

Again, see above. Also note that the Mexican goverment's 'FCC' is tougher
than ours when it comes to enforcment. One foul language incident can take
you off the air!

You probably will have seen this by now but this months (July 1996)
edition of
HAM RADIO TODAY has a construction project for an add-on synchronous detector.

I am thinking about building this into a small superhet I will be building
later in the year when I may have more time.

If you build this or any other synch detector I would be interested in how
you rate it.

Check the HAM RADIO TODAY web page at:

Why? The SS LAN cards are Part 15 devices. There's nothing in Part 15 (or Part 97 for that matter) that says they can't carry traffic from the amateur service yet still operate under Part 15 is there? Maybe I'm missing something obvious here, but I don't see why there would be a problem letting the SS LAN card operate as a Part 15 device even though its carrying amateur radio traffic.

(Scenario) Assume I'm not a ham. I buy a pair of SS LAN cards. I connect one side of the link to a machine that has a TNC connected that picks up amateur packet traffic off 145.03 using a scanner. I have all monitored ham traffic go across the SS LAN link. I haven't transmitted on 2m, and I'm operating the SS LAN cards under Part 15, so it's cool. Then I get my tech license (with code of course ;-)). Just because I got my ham license doesn't void the Part 15 status (or legality) of the SS LAN link. I do need my ham license to transmit on 2m, of course, but not to operate the 900 MHz Part 15 link. Am I right?

FWIW, I've used Telesystems ARLAN III cards as well as AT&T (formerly NCR) WaveLAN cards in several commercial installations and they've worked well. In one installation, the yagi connected to the WaveLAN card was about 30 yards away from a cell site. I had to use a custom-built combline filter from Tx/Rx (902-928 MHz) to get enough selectivity to keep the nearby cell site from hammering the card.

This thread has reminded me of something I haven't thought about in a long time.

About twenty years ago, I was discussing self-sufficiency with a friend who was familiar with a number of different non-electrical technologies. He had concluded that if one could obtain all the necessary parts, the best way to generate and store power on a small scale would be compressed air.

The general concept would be to use a windmill or turbine, but instead of generating electricity, the unit would turn an air compressor that would pressurize an underground tank. Because electricity isn't involved in the generation and storage of the power, the primary maintenance cost, i.e. storage batteries, would be eliminated.

The primary drawback to such a system is, of course, how to use the compressed air to power electrical equipment. To produce electricity, a fairly large "air motor" would be required in order to drive a generator of decent size.

Does anyone know if there have been any developments in this field, and whether off-the-shelf components are available for such a system?

73,
Jack WB3U

I recently purchased one of these very useful instruments at a very good price. The problem is, I didn't get a manual or probe. Does anyone have a manual that could be borrowed, or question answered from?

Judging from the connector, I would assume the probe has active circuitry, and therefore will have to be located and purcahsed or possibly constructed. Any one have a clue?

Source record: 104701

I am building a 6th order butterworth bandpass filter for the 2 meter band (hoping to kill the intermod problem at my location), but some of the inductors are just too small to wind using conventional air coil designs. I have seen the use of strips of metal to do this, but I do not know the calculations involved. The ARRL book I have shows lots of projects using pieces of wire or strips of metal, but they do not tell you how to calculate the inductance.

Can anyone give me dimensions for a .001 microhenry strip, and also maybe some strip line formulas, so that I can create my own inductors.

Thank you very much,

Maiko

I believe this qualifies as a factoid. The lowest water absorbtion
frequency is actually a little below our 24 GHz band.

The frequency is based on 3 factors.
1--Got to keep the RF from leaking out of the oven (door seals).
2--Can't interfere with authorized services.
3--Has to cook food all the way through.

The old ovens were in the 915 MHz ISM band and moved to
2.4 GHz for better door seals. You can actually cook hot
dogs with a 200 watt 2M amp if you put it in a cavity and
tune it up.

Amidon was once run out of the Amidon house garage (I've been there
a few times). They've sold the business, and it changed address
several times over a few years before settling down where it is now.
This made some people think they were defunct, when, in fact, they
still offer excellent service (at least in my experience).

Thanks for reading this. If I have posted to the wroing group please
let me know.

With the advent of the new cell phone technologies such as Satellite,
the 'older 900 Mhz cell phones' are more-and-more available on the used
marked (I purchased my Motorola at Dayton for $US 25). I know these cell
phones are programable, but just how programmable may be the question.
These units have a display, battery level indicator, some have 5 Watt
output, keypad entry, to list a few. Motorola has a very high quality
product, surely these phones (or others) can be reprogrammed for FM HAM
use.

Can these cell phones be reprogrammed for the HAM 900Mhz use? If so are
the resources available to do this? If the bandwidth can be changed
imagine the packet applications? Or, is this just a loonie idea?
Cheers,
'73 de VE3SLJ.

I built this kit back in late 1990 when the QST article first appeared.
Been using it ever since. Excellent keyer. Newer model has upgrades
that mine doesn't. Currently marketed as the K-1 Logikey. Selected by
Kenwood to be standard equipment on the superb TS-870S transceiver
(which I also have, and this is one reason why I bought this rig).

I do have a manual for the thing, because I was interested in obtaining a unit myself. From as far as i can see, the critical element is the probe. Without it the unit is worthless. After looking at the circuitry of the probe, I can't see an easy way for a hobbiest to construct it.

I would be interested in selling you the manual if you are still interested.

A less expensive and easier modem to build for
use with the BAYCOM/PMP/EZPACKET software uses
the TEXAS INSTRUMENT TCM3105JL chip. This modem
is programmable for a variety of baud rates and
options. But the 1200baud/half-duplex mode is
used on packet radio. With the addition of a few
components and a crystal, tied into either the
Parallel or Serial port, you are on the air.
The TCM3105JL has been discontinued but they can
still be found at parts houses and in old modem
equipment and TNC's. Good Luck.

Getting a little off from home-built radio, but your post reminded me
of a similar idea I had. I have a sloping property with my well at the
lowest end. I was thinking of using wind-power to pump water into a
cistern at the uphill end, and running a generator off a water-wheel by
returning the water to the well, (abt 50 feet difference in elevation in
this case).

And, while we're off the topic, here's a funny windmill idea... Engine
block mounted upside down on a tower. windmill sails welded to the
flywheel. an extention welded to a con-rod for operating a pump -
alternator left in place for charging batteries. I got this last from an
old-timer who claimed to have built such a thing.

Does anyone know what happened to Anzac corp?
They were a division of Adams-Russell and made a nice 50-to75 ohm
transformer.

I would be _really_ surprised if this is possible. To meet the requirements of the cellular system, the phones need to receive in one frequency range and transmit in another, similar to the way cordless phones work. There are no advantages (and some disadvantages) to designing the Rx/Tx circuits to operate up above the current highest frequency of ~896 MHz.

My guess is that you would need to do some serious re-arranging of the Rx/Tx system in the cell phone to get it to work in the Ham bands - probably not worth it.

I hesitate to mention this, but if you're looking for info on reprogramming cell phones, the current issue of 2600 has some rather detailed info on reprogramming various models of Motorola cell phones. I have no idea how reliable this is and I certainly don't advocate using this for illegal purposes, but if you have one of these phones it could be helpful.

In that regard, how good are these phones as recievers, say with a
good antenna and LNA attached? My particular interest is in radio
astronomy (non-SETI, just astrophysics stuff) so a wide-band IF is
actually a plus. Ideally I'd like to kick down to the 600 MHz astronomical
allocation, but working upward to 1.4 GHz is probably asking too much.

More to the point, a lot of cell phone chips and such are becoming
available which could be more properly used for this (and ham radio)
applications. A good reference on this kind of "conversion" would be
appreciated.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
June 16th, 1996
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

3796. Novice QRP

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-12 00:00:00 UTC
From: mildfedc@quicklink.net
Message-ID: <4pl8de$968@news.quicklink.net>
Source record: 104720

I wonder why there is a lack of QRP rigs available for novice freqs.
All homebrew/kit qrp rigs are set up with crystals in the general
class freqs.
Wouldn't it make sense to offer then on 10M or in the novice portion
of 40M to get new hams to learn code? or am I just wishing.
I am a technician class ham with my 5wpm code endorcement, and am
tired of all the stuff on 2M, of packet, of SSB, of all the other
"hot" stuff. Sold all my HF gear...sold all my packet gear....sold
all my 2M gear...and bought me a qrp rig with novice crystal in it for
40M. Gonna start at the bottom...learn my code like I should have
years ago...and enjoy pounding brass for a change.
Seems like the faster we run....the quicker we get back to where we
were. Go figure.
Let me know what you think.

This does relate to amateur radio, I promise!

Recently, some power companies have been using the very technique you're talking about to stretch their capacity. During the daytime (especially summertime in warmer climates) they just don't have enough generating capacity to handle the load. Their local "Public Service Commission" doesn't want any more polluting power plants, so they can't build coal or gas-fired generation facilities. Their load at *night* though is much, much lower.

So, at night they pump air into empty salt mines while they have the power available. Then during the day they blow it through high-efficiency turbines to drive the generators. Zero pollution produced at the new generation facility (though we all know it had to happen back at the ol' coal plant anyway).

On a smaller scale, it's almost always more economical to use some other energy storage technique that's closer to the application at hand (like making ice at night to get cool air at noon). In that same way, it may be more economical for the ham to use 12-V storage batteries and make sure their equipment can run off of it *directly*, rather than through an inefficient converter.

Any time you convert energy, you lose some. Usually, you lose a *lot*.

>references. TIA! -Gerry

An excellent book is "Crystals and Crystal Growing" by Alan Holden and Phyllis Singer (she might have a new last name by now; my book was pretty old) which gives thorough descriptions of, well, crystals and crystal growing. Besides setting up general principles (excellently), the book also provides specific how-to recipes for a dozen water-soluble salts, and Rochelle salt is one them.

I've grown that one myself. It grows fast and well if conditions are right, but the stuff has such a high temperature dependence of solubility that "right conditions" mean mostly a pretty damn stable temperature; the book goes into this. During a lucky spell in weather - I didn't have a temp. comtroller - I got a crystal just smaller than a roll of 35mm film in four or five days of growth.

Once.

Is there any way that I can measure the input and output
impedance of transistors at high frequencies (eg 100Mhz)
with relatively simple equipment.I know that most rf transistors
data sheets come with these parameters (S & Y params)
but how can you find these parameters for transistors that don't
have these in there data sheets.
I know that this is probably a bit of a long shot,but is there anyone
out there who can help me.
Cheers
Robin
PS:the equipment that I have available to use:multimeter,20mhz scope,200mhz freq
counter,110mhz sweep/signal generator.

(snip)

Mark,
First thing I'd suggest is locate a library or another ham who has a complete collection of 73, QST, Ham Radio, and CQ magazines from about 1977 through 1983 (plus or minus). Look through the December issues of each magazine and find the Annual Index of Articles. Search these indices for 10m FM conversion articles. You will find every bit of info you need there. I used to have a three-ring binder full of 10m FM conversion articles, but I can't find it (I may have loaned it to someone and never gotten it back -- bummer!). All of the info I had came from the sources I've suggested above. In the early 1980s when the 10m FM boom really took off, I converted literally dozens of the "Cybernet" PLL-02A chassis to 10m FM (again, look in the magazine articles for particulars on which ones are convertible and which ones are not).

Good luck and 73 de KC5NG

1nH is a very small inductance - the same as about 1mm of component
lead. You may have trouble realizing this value practically. I'd
look at re-synthesizing the filter to get more practical values.

From: engineer@train.com
Message-ID: <4pp1gj$4qn@news72.supernews.com>
Source record: 104639

Got a project using double row, .250 inch wide, male "Fast-On" tabs. Used to get them from a local surplus house but their supply has dried up. Approached manufacturers who are all happy to tool up for 10,000 pieces but not interested in selling me only a 10 year supply!!!!

I've mailed an inquiry to all the big names in electronics surplus . . . Hosfelt, MP Jones, etc. I gotta believe that what I'm looking for is probably in stock in great abundance . . . somewhere. Is anyone aware of local storefront surplus stores that I could write to?

I can use either continuous reels or segments of 6 or more pairs of tabs. They need to have a single, clean hole between the tabs . . i.e. these get sweat-soldered to a brass sheet. Can't use the type that are "self riveting" to an etched circuit board for this project although I would be interested in that type for another project.

A name/address/zip of your favorite "junque" store would be appreciated!

Mark... the cb to 10 meter conversions were real popular in the early 80s
, several of the ham magazines particularly 73 ran a number of articles
on these. With regards to current equipment, I don't have any
suggestions. I have one 40 channel CB that's already converted to 10 FM
along with a 50 watt amplifier. I was going to put in our club's auction
in September, give me a call if your interested.

It sounds like you may have taken a normalized design or one for another frequency and scaled it to 2 meters. Sometimes this procedure results in extreme component values -- a 1 nH inductor probably qualifies as being in this category, depending on the construction techniques you have available. You might get lucky and make something that works, but I'd doubt that it would be repeatable if that's your goal.

Any good book on filter synthesis will have a large section devoted to transformations which shows you how to make the same, or very nearly the same, filter response with different components. This is used to find a topology which has component values you can actually realize.

> Mark,
Hi Mark. I've found the 23 or 40 channel Hygain boards to be easy to convert. The ones that use a PLL02A pll IC and 3 xtals (10.240 and 10.595 mhz and a 3rd I can't remember at this moment). They have a greenish PC board and were made for Hygain, Midland, Kraco (K-Mart), etc. They're pretty easy to spot around hamfests, flea markets, yard sales, etc. The newer CB rigs are next to impossible to move into 10 meters.

I build my own FM discriminator for FM detection, and modulate the VCO directly for true FM transmit. A model with a noise blanker is a plus. The TX move requires a couple of the coils in the PA circuit to have a turn or so removed.

If you drop a SASE to my callbook adress I'll be happy to send you a copy of the info I have.

> allready been converted to 10 meters they can be converted back very
> easy.

That's not correct. It's the other way around. The Uniden 2510, and I
think the Ranger, are 10m amatuer radios that are easily converted to CB
bands. The 2510 is a (Non Junky)all mode transceiver for 28.1 to 29.7MHz.
One cut and jumper expands it down to 26.0Mhz.

You can use modified commercial or CB radios in the amateur bands if you
have an amateur license, but you can't modify any radio to operate in a
commercial or CB bands. Radios for non-ham bands generally need to be FCC
type-accepted, which a radio you modified would no longer be. Amateur
radios don't need to be type-accepted, so you can make/modify your own
radio for use in the ham bands.

As far as Mark's question, I have an old Uniden Cobra 148 that I've been
wanting to convert to 10M. They're readily available and the schematics
are easy to find also. I'll have to select a few new components in the RF
section because it's not going to work too well 2MHz out of band, but I
think it's reasonable to do it with this radio. It only outputs 5 watts
(all the cheaper CBs will put out around 3 watts), so it will be my QRP
radio in a couple of years when 10m opens up.

3821. Half duplex robot communication

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-13 00:00:00 UTC
From: random@sal.seanet.com
Message-ID: <random.45.0013B592@sal.seanet.com>
Source record: 104649

I' looking for a quick and dirty, 6 or 2 meter, half duplex, AM (or FM) modem circuit that will support a 50kbaud signal. The link will be between a host computer and a mobile robotic platform no more that 50 feet away.

I was thinking of 100% modulating an off-the-shelf oscillator can for a transmitter, and using a matching crystal as the input discriminator (following a relatively broad input filter/amp). 50 mW should be enough power, although I believe up to 1 watt is allowed for 'radio control'.

If you've got a similar circuit laying around, know where one is, have comments on pitfalls, or would like to do some tinkering and live in the greater Seattle area, please respond. By the way, this all needs to be done in about three weeks.

3822. Homebrew receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-14 00:00:00 UTC
From: CORDESSES Roland <cordesse@opgc.univ-bpclermont.fr>
Message-ID: <31C16123.25DF@opgc.univ-bpclermont.fr>
Source record: 104650

Hi there

I have received some inquiries about my home made receiver shortly
described in a recent message. Some of you asked me about my homebrew
crystal filters so now I give a few informations on the subject :
First I don't claim for any original ideas: I merely used techniques
and methods already published.
1. The I.F frequency . I use 8MHz : I choosed this value after many
tests on several batches of currently available crytals of different
frequencies (price in the order of $1.5 each). I found that Philips
made 8MHz crytals were good as far high Q and low dispersion were
considered. Furthermore this frequency was in the range I was looking
for. So the I.F frequency was determined !!
2. Filter computation and construction.First I measured the equivalent
circuit values for each crystal using the methods described by Hayward
(1,2). Then I computed the capacitor values (parallel coupling and series
tuning caps) with the Hayward programs included in the book "Introduction
to Radio Frequency Design"(3). During this phase I picked ideas and hints
from the 1995 Makhinson paper dealing with crystal filters (4).
Then I build the filter using carefully measured capacitors and the
result was very near the computed value .
Some characteristics of my filters are :

2300Hz 12 poles Chebyshev model (main filter):
Band pass (-3dB) : 2350 Hz
Shape Factor (6/80dB) : 1.6
Zin=Zout : 300 ohms
Insertion Loss : 3dB

2700Hz 4 poles Chebyshev model(noise filter):
Band pass (-3dB) : 2700Hz
Shape Factor (6/40dB) : 2.6
Zin=Zout : 320 ohms
Insertion Loss : 2dB

400 Hz 6 poles Butterworth model :
Band pass (-3dB) : 390Hz
Shape Factor (6/60dB) : 4.5
Zin=Zout :450 ohms
Insertion loss : 12 dB

A word of caution : don't try to build a filter in a very small box be-
cause parasitics increase and performances are difficult to obtain.

It takes time and you have to work thoroughly to build crystal filters
but the result is worth the effort : these filters are better than any

commercial units I have purchased in the past.
I would like to thank W.Hayward for the nice tools he designed and the numerous papers he wrote and J.Makhinson for sharing ideas in the art of homebrew receivers anf filters.

Good work and 73's

> between the VFO and mixer.

I saw this idea mentioned several years ago. In my view, optically coupling the output of a VFO would be worth considering in the case of a direct conversion transceiver.

A 30 m DC TRX I built some years ago suffered from 'pulling' of the VFO by the transmitter final, this in spite of elaborate shielding and decoupling. I suspect the reason being the fact that the entire TX train operated on the same frequency, making the VFO very sensitive to feedback.

Has anyone actually tried this? I would probably try an opto-isolator with a photo diode as the receiving element. The photo transistor variety has better gain, but is slower.

From: psoper@encore.com
Message-ID: <DszvA2.Mr7@encore.com>
Source record: 104653

Hi folks,
Could someone show me how to properly design a simple circuit
to put across relay coils to make their switching as electrically
"quiet" as possible and minimize the stress on the circuits
driving the coil? I know the voltage and current of the coils
and will be putting an LED and its dropping resistor across
each, but think a properly selected small cap (or other components?)
would help with the back EMF when the relay is switched.

This is for a "Cecil Moore" balanced line tuner which I've
started constructing. I'd call it a "KG7BK tuner" but I know
Cecil is looking to switch callsigns :-)

Once gain my Usenet provider is fouled up so direct
email would be appreciated and I promise to post any worthwhile
info back.

Regards,
Pete

>the remoter 10 meter transmitter.

I haven't tried to link repeaters via a laser, Tim, but I have experimented with lasers as communications links. The most obvious problem is fog, rain, haze, or smoke in the path. On foggy evenings, your effective range can shrink to a few hundred feet. Rain has a lesser effect, but still cuts range dramatically. Haze and smoke are normally just nuisances, but I could imagine conditions where they would stop you short of 7 miles too because of beam dispersion or absorption.

It isn't practical to use FM modulation with a laser. Most experimenters use simple AM, but at least for gas lasers, you can't achieve more than about 20% depth of modulation without quenching the laser. This low depth of modulation leads to SNR problems. You can use a Kerr cell, but that's expensive.

So you should consider pulse modulation using digital audio, or polarization sense modulation if you want to use analog audio. You can't pulse a gas laser fast enough, so you're back to a Kerr cell to pulse modulate the beam, though if beam power is low enough you could use a transmission mode LCD shutter instead. You can pulse modulate semiconductor diode lasers. These generally don't offer as much power, and the beam collimation is generally much worse, but you might do 7 miles with good optics and perhaps a bit of FEC.

Polarization modulation can be an option. You can get electrically driven polarizers for a reasonable amount of money, and you can receive using two oppositely polarized filters in front of photodiodes connected in a bridge circuit. This can sometimes yield SNRs almost as good as FM, though there's no FM enhancement effect.

Note: 50 mile terrestrial paths can be achieved under certain conditions using any of the methods mentioned above, but if you need a reliable link, don't count on such long range links being functional 7x24. If you live in dry high desert, and you can keep the beam path out of mirage, it might work, but otherwise I think you'll be better served by a RF link.

After some WWW surfing and no luck, can someone help?.....

Is there available an electronic's encyclopedia (reference CD) that is a compilation of various data books, parts schematics, symbols, pinouts, etc available in CD format?

Essentially, a CD that can be used as a hobbyist's point of reference?

Thank you in advance!

Tony Komljanec,

I have done it with an insterment. I took the out put of the mixer and ran it
Through a Motrola fiber optic kit to act as a low pass filter. It used a NE602.
We never checked audio quality but the waveform looked OK. The fiber had a
cutoff of 1 MHZ.

It rendered a very twitchy device pertty stable.

Considering the *severe* restrictions on SS operation in the amateur
regulations, you shouldn't be surprised that amateurs haven't done
much with SS.

>73 de Lennart, SM5DFF

Bingo! You've hit it on the head. Microwave oven transformers are designed to saturate to current limit the magnetron. A maggie is just a diode with resonant cavities and a permanent magnetic field. There's nothing limiting current flow through them except the power supply (and filament emission, but that's a poor way to limit peak currents). Microwave ovens use halfwave rectification and no filtering so that the maggie is really pulsed at a 60 Hz rate, with the peak current limited by transformer saturation. This is cheaper and simpler than designing a pure DC supply with integral current regulation.

Note: a maggie can be allowed to self-rectify, and thus not require an external rectifier at all, but that can lead to safety problems, IE the tube anode would go below "ground" on alternating half cycles. By using an external rectifier, the anode can be operated at "ground" potential, thus simplifying mounting problems.

From the National CMOS Logic Databook, it appears to be
common-cathode. A common-anode display can be driven by using an NPN
transistor.

3837. Denver sale: Parts & Power Supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-14 00:00:00 UTC
From: Lady Robin <ladyrobin@earthlink.net>
Message-ID: <31C1AE5A.5908@earthlink.net>
Source record: 104665

Iï¿½m an Electronics R&D Technician and have been working in the electronics field for many years in the Denver metro area and have sometimes accepted parts or equipment as payment for small jobs, or in trade. Sometimes I bought things it turned out I didnï¿½t need, or I didnï¿½t use later. Itï¿½s time to clean out the garage so we can continue to be able to park the car there ! My other half says: ï¿½Get that stuff out of here!ï¿½ I can give you some very good deals on some choice electronic parts, other equipment and power supplies, if they happen to be something you can use! In the case of the circuit breakers, you might even consider designing them into your equipment on a temporary basis because there are so many of them at a very good price that it might be in your interest to do so. Cash or money order as payment, COD. Thanks.

Here's what I have:

Nichicon 1500 uF 100V Have boxes of them!
Mepco 90,000 uF 20V boxes of them!
Sprague 36DE1106 27,000 uF 25 VDC
Mallory CGS494U010X8L High performance; long life; 490,000 uF 10 VDC Boxes of them!

Soldering Stations: Ungar UTC 200 and Model 9000 I have a few of each, used and in good working condition. Both have variable temperature controls. $70 each + shipping if needed.

MRF138 ! I have some of these brand new that I'm interested in selling. They're N-Channel Enhancement Mode RF Power FET's and run 30 Watts from 2-175 Mhz. They're in Case 211-07. They sell for $45. each in the catalogs. How about $25 each?! In anti-static bags, of course.

Circuit Breakers for electronics equipment! ; Potter & Brumfield #W58XB1A4A1 (1 Amp), A whole carton of (480!) brand new originally purchased from Newark (#56F870) and cost $10.07 each in single quantity and $7.64 each in 99 quantity! They're the type almost everyone's seen at one time or other; brown with 1/4" quick/solder connects in back & a round white reset button in front with the ï¿½1ï¿½ on it. There are 480 of these choice babies in the box, brand new! Perfect for building into some new equipment! Want them for $4.50 each?! Make me a reasonable offer that you would consider a good deal ; negotiate!

Microsoft Windows Sound System; Brand New! Includes board & software. Allows voice commands of software, playing of system sounds, better game sound etc. Sent registration in but new in box, never used. Card & software pkg are unopened! How about $70?!

AT&T Answering machine.

Genoa 7900; 24 bit Super VGA card goes up to 16 million colors, brand new in original sealed bubble pack box. How about $70 ?!

Do you have backup capability on your computer?! Do you know where your data is?! Irwin A120 Tape Backup Drive & 3 Tapes. 1/2 height. Backs up 60-120 Megs per tape. With manual

& disks. Remember this is with tapes, compared to others without tapes and backup tapes generally cost around $18 each at computer stores like CompUSA. How about $80 for everything?!

AT&T Answering machine; 3 yrs old, works.

Power supplies:

LH Research switchers model # MM-11. 115/230 VAC input, 5 volts @ 75 Amps! single output. I have probably 20-30 of these beauties! Very nice condition, almost new! For those not familiar with LH Research, they make very rugged reliable power supplies that barely get warm at full load! They sell for hundreds each new. $75 each!! Put 2 in series, turn up the voltage adjustment (you could get 10.5 volts total that way) & run 12 volt rig(s).

I also have some LH Research switchers 12 Volt, 62 Amp model MM-31; similar style to above! They sell for around $450 new! $160 each!!!

Power general switcher; 1060-1, 115vac in, 5 vdc @ 12 Amps out.

Sola 83-12-218-2; 115/230 vac in, 12 vdc @ 1.8 a out.

Xentek XE240-5; Linear. 115 VAC in, 5 volts @ 50 amps out.

Xentek XE90-15; Linear. 115 VAC in, 15 VDC @ 8.4 Amps out.

Cherokee Switcher 115/230 VAC in, 5vdc @ 75 A, +/- 12 VDC @ 6 A, -5VDC @ 6 A, 24 VDC @ 10 A outputs!

>for such a system?

Some utilities use it for load leveling. There are several
gotchas for the home user, however. The main one is that
air motor efficiency depends greatly on load. You can make
an air motor that has good efficiency at any given load,
but not at varying loads. This doesn't bother the utilities
since their system has mixed generation and they can plug
the air driven source in at a fixed load factor, handling
the load variations with other schedulable generation.

But for the homepower user, it is a killer. If you size the
air motor to power all your loads, it will be horribly
inefficient when you are only using a few loads. But if you
size the air motor for only a few loads, you can't supply
a heavier load on the occasions you need to run it. Several
small air motors could operate generators in parallel, starting
and stopping depending on the immediate load, but regulation,
mechanical complexity, and cost rapidly get out of hand.

Secondarily, air storage isn't very energy dense, IE it takes
a *big* tank to store significant energy. And if you use high
pressures, that big tank can be dangerous too. Some work has
been done using long runs of buried high pressure tubing as a
storage tank. This reduces risks, and sometimes costs too, but
it still has to be a *large* installation to store significant
power.

You're better off pumping water if you want mechanical storage.
Many utilities do this. It is lots easier to get efficient
water turbines over a varying load range than it is to get efficient
air turbines over a variable load range. That's because water
is not compressible. Output is directly proportional to water
flow rate over the entire load range.

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

PTT means PUSH-TO-TALK, or a means of initiating the TRANSMIT functions on
voice transmitters/transceivers. You won't have such a thing on a receiver.

Source record: 104585

Where is 6m am activity usually found? 50.2? Calling freq.?
How about 2m am, if it's ever used anymore? What freq.'s?

Regarding antennas, would a ground plane or horizontally polarized antenna
be best for 6m band openings when using this mode? From what I
understand, antennas for weak-signal ssb/CW are horizontally polarized;
not sure what would be appropriate for am/dx. Thank you, 73

I recently took an interest in this myself. You should check out the
Longwave Home Page: http://users.aol.com/lwcanews/lwcanews.html
The section "File Library" includes a link "Natural Radio Files"
Which points to a couple of different designs. The page has all
kinds of other useful info on VLF.

Floating around at gun shows now are 20mm cartridge carrying cases. They are made out of a black plastic, extremely heavy construction. I do not doubt they could be run over by a small car with nothing over than minor scratch damage.
The point of this post is, they make a godzilla radio or battery carrying case. The one I bought holds 5 7Ah gell cells. It would also hold a small QRP rig, antenna, battery and accessories with no problem.
The "lid" has a waterproof seal, and both ends are hinged, allowing access to both ends of the box.
I paid $8 for mine.

Surplus stores around here (Silicon Valley) are selling chip resistors
and caps for as cheap as $0.50 for 10. The price seems to be getting
more reasonable but I guess it has not spread around the country yet.

I think Digi-Key (http://www.digikey.com) sells a range of SMT components
but the best deal seems to be the designer kits of standard values. One
of these is probably worth the investment for the serious home brewer.
After that, you could just buy single value replacements for the kit.

Good Luck

Since most TV stations now generate there own sync and color and the network feed most likely is run through a digital frame synchronizer to alighn it with the station, your standard would only be as good as the TCXO in the station's in-house generator.

If you want to use a good comon reference from television, I would suggest a cheap Ku band satellite receiver to get a network feed (such as NBC). Since the dishes are small, it would be reasonable for two amateur stations to have the same clock. Otherwise Loran, GPS etc. are good alternatives.

Absolute stability is not really needed. If all the stations are drifting together, who cares?

I thought (Maybe I'm wrong) that these are 800Mhz phones? If so quite a switch in range. There are some REALLY neat parts for 902Mhz and I'm working now on a project for that band. It may be easier to just go scratch than figure out a phone. For instance they have a single chip that takes the input freq and outputs 64X the freq. With an input to FM the output!

Let me help you find information on the 1750 meter band. Start with:
http://users.aol.com/lwcanews/ (Longwave Club of America)
If you are in Europe and interested in the new 73 KHz frequency:
http://www.users.dircon.co.uk/~stonix/73kHz/
Then when you really get serious about doing something useful, check with
Bill DeCarle VE2IQ:
http://w3.ietc.ca/home/bill/bbs.htm

The 1750 meter experimeters usually are hams. Only recently has ARRL
acknowleged this license free band. There is very little "store bought"
equipment available making it an EXPERIMENTERS band!

3872. RF/Amateur Radio Design program - Its free!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-17 00:00:00 UTC
From: davek@medphys.ucl.ac.uk
Message-ID: <1996Jun17.090240.27774@ucl.ac.uk>
Source record: 104530

Over the years I have written a number of small PC programs for solving
RF problems - some professional, others amateur radio. These have now been
put into one program, which may be of use to others. If you want it, complete
with source, please ftp from

medphys.ucl.ac.uk.
Username=anonymous, password = your e-mail address.
get file pub/users/davek/rf/rf.zip

HERE is the README.TXT file. Please read the warnings about me not have the
time to produce decent documentation, so unless you like a challange, its best
you dont get it. Also, note that since its free, there are no guarantees it works-
in fact I know some bits dont - see README.TXT.

RF - A Program to Solve a Number of Radio Frequency (RF) Related Problems.

This DOS based public domain program was written to solve a number of problems
encountered in by professional work and for amatuer radio use. The program has
a number of routines, that solves problems as diverse as designing attenuators,
finding the free space path loss, noise and IP3 of a number of cascaded stages,
selecting blower requirements for valves, designing inductors, finding the
characteristics of transmission lines (both waveguide and coaxial of various
forms), designing RF pre-amps etc etc etc. All the routines were designed to
solve a problem that I (or in some cases someone else) had, at particular instant
in time. Hence the amount of work put into the individual routines depended on
the amount time I had available, the importance I attached to the individual
problem etc etc. Many of the routines are unfinished, having served their
purpose. Some have never really been started. Others work well.

At the present moment in time, I have not the free time nor inclination to
produce any decent documentation. There is however some built in instructions
describing the use of each routine. I would not have bothered to release the
program, but as a few people have expressed interest in the individual routines,
I have done so. Here is a list of the sort of things the program does.

0: EXIT 20: Path loss calculator.
1: General Introduction. 21: Stability from Puff files.
2: Convert real impedances. 22: 2-way microstrip power splitter.
3: Convert complex impedances. 23: Power tube blower requirements.
4: S parameters to lumped circuit. 24: Blower selection.
5: S(dB) to lumped circuit. 25:
6: Series LRC circuit to S. 26:
7: Parallel LRC circuit to S. 27:
8: Build a T, □ or L attenuator. 28:

10: Design a power splitter.
11: Filter design menu.
12: Inductor design menu.
13: Resonance and Q calculations
14: Mixer product calculations. 34: Mixer sprogs - use Minicircuit data.
15: Cascaded NF and IP3.
16: Power conversions.
17: Series/parallel resistor.
18: Transmission line calculator.
19: VSWR, rho and % reflected power.

Numbers 14, 22 and 34 are not really working well. I would deleted them, but its more hassle to do that than tell you they don't work. I gave up with #11 (filter design), since there are good filter design programs around. However, it does implement the constant impedance band-pass filter correctly, which is useful (ie after a mixer) and not well covered in the normal filter design programs. No 23 (blower requirements for valves) is not working properly, so don't use that. I do intend sorting this out (unlike numbers 11, 14, 22 and 34), but so far have not had enough time to find the theory necessary to solve it properly. Most of the others work - more or less. Number 9 is quite clever, as it attempts to deign an RF pre-amp from the S-parameters of the FET used and the DC conditions form the FET. However, it does not test all posibilities for designs, but I think any results it gives are correct.

The program needs ANSI.SYS installed (by puting 'device =c:\dos\ansi.sys' or similar in config.sys). The program is supplied as a compressed ZIP file, RF.ZIP.

Dave Kirkby, G8WRB.

PS If you spot any bugs in the program, or understand how to do what #23 tries to do, please let me know.

>
>-Tom
>

Sure, you can make a MMIC oscillate. You just need to give it a feedback circuit that provides the required phase shift at the frequency you want oscillation. If your MMIC gives, say, 160 degrees of phase shift, you need to make the phase shift so that the fed back signal adds in phase at the input. (Of course, the feedback needs to have enough signal level so that the net gain around the loop is at least 1).

There have been some magazine articles on doing this, but I don't know the references right offhand.

I think this answers the question....

73,
b

From: daveaa1a@pcix.com
Message-ID: <4q2ee3$62p@alpha.pcix.com>
Source record: 104601

Some time ago I received many correspondence speaking of Frequency accuracy anf how to get it best.
Since then I have stripped 3.58 color burst off network, Loran 'C' from Nantucket and WWV.
For CCW or Spread spectrum purposes, what type do you prefer/use/reccomend.

I'm thinking that Network Color burst say from ABC or any network available to both parties involved
via cable or terrestrial is the way to go.. As long as both parties are using same reference, does it
matter if it's not 10-14th??

Planning to phase lock my 10ghz brick and LowFer Beacon.. What should we use??

50.125 MHz is the national calling frew for SSB.
Most activity is from there to about 50.250.

Horz. pol is typ used for CW/SSB, Vert for FM.
Polarization can make big difference for local
work, but for dx openings is less important, it
can shift during propagation.

Alternatively from buying Pauls unit....

I found an " Economy Radar Detector " on the web under
CyberCircuit (Circuit du Jour)

It was lifted from " Radio Electronics " Magazine Jul 86 issue (c)
Gernsback Publications Inc. 1986...

Mind you this is old technology, but works...sort of.

Cross-posted to: sci.electronics.repair,sci.electronics.design,rec.radio.amateur.homebrew

NOTES ON DESOLDERING

Michael Covington, N4TMI
mcovingt@ai.uga.edu

YOUR COMMENTS ARE INVITED!

I would like to hear from anyone who has experiences to share.
I would especially like to know more about:
- heated Soldapullt-like devices;
- vacuum desoldering stations (Hakko, Pace, etc.)
neither of which I have ever had the opportunity to try.

WHICH TECHNIQUE IS BEST? I use the hot air gun for ICs with 16 pins or more, the Soldapullt for smaller devices.

1. INTRODUCTION

These notes are based on a series of tests that I conducted to try to find the best way to desolder ICs from 4-layer computer PC boards. This is the most difficult desoldering task that I routinely face.

2. THE TIME FACTOR

Desoldering can take time. Removing a 40-pin IC neatly with copper braid can take 30 minutes. That's over $50 worth of technician time, counting overhead costs. Now you know why most people don't repair computers at the component level.

Removing the same IC with the hot-air-gun technique described below takes less than 1 minute, plus another few minutes to clean up the holes with copper braid. Other techniques take intermediate amounts of time.

3. SHORTCUTS

I am assuming you want to preserve both the board and the IC. If you know the IC is bad, you can crush it, clip off all its pins, and then remove the pins one by one. If you want the ICs but not the board, you can heat the board in various unorthodox ways (propane torches have been mentioned) until the solder melts.

4. UNBEND THE PINS FIRST!

Regardless of what technique you're going to use, you should unbend any crimped IC pins before trying to pull the IC out. You can often do this with a tiny screwdriver before desoldering. Sometimes you must remove some of the solder before the pins can be straightened.

5. FREE UP THE PINS BEFORE PULLING!

After you have removed the solder from a joint by any of various methods, grip the pin and wiggle it with pliers to break it loose of any tiny amount of solder that may still be holding it to one side of the hole. Always do this before trying to pull the IC out of the hole.

6. COPPER BRAID

Although rather slow if used by itself, copper braid is an indispensable desoldering tool because of its almost magical ability to pull solder out of holes by capillary action. It's especially handy for cleaning up the solder left behind by other techniques.

Method:

a. Heat iron to 750 F. Insert small tip (end of tip roughly same diameter as hole in circuit board).

b. Place the board flat on the workbench, solder side up.

c. Swab some extra flux on the joint to be unsoldered. (The copper braid contains some flux that _may_ be adequate.)

d. Lay down a piece of copper braid on the joint and apply the soldering iron to it.

e. Inspect your work. With a single-sided board, you may be done. With a multilayer board, you may have to attack each joint as many as five times, using fresh copper braid each time.

Common faults:

a. The copper braid should not be spread out; it should be tightly bunched together. It comes in various widths; match the width to the joint if possible.

Handy hints:

a. You can do several IC pins in rapid succession by laying down a piece of copper braid along them.

b. Trim off the used end of the copper braid before using a fresh spot on it; that way you don't have as much metal to draw heat away.

7. VACUUM TRIGGER PUMP ("SOLDAPULLT")

This technique is faster than copper braid and works very well.

Method:

a. Heat iron to 750 F. Insert small tip (end of tip roughly same diameter as hole in circuit board).

b. Lay board flat on the workbench, solder side up.

c. Quickly re-melt each of the joints and add a small amount of solder to it. This adds some much-needed flux; it also ensures that you have melted through any protective coating on the surface that would otherwise interfere with heat transfer.

d. Apply the soldering iron to the joint. As soon as it melts, move the tip of the iron to the edge of the joint and put the Soldapullt in place.

e. Count five seconds (to ensure melting all the way through the layers) and press the trigger.

f. If the pin is adhering to one side of the hole, free it with the tip of the soldering iron or with pliers.

Common faults:

a. Don't be shy about letting the tip of the Soldapullt touch the tip of the soldering iron. It's unavoidable, and so long as the area of contact is not large, it doesn't do any harm.

b. Make sure the Soldapullt is in good condition. Cock it, put your finger over the end, and press the trigger. The plunger should _not_ go right up. Ideally, it should stop about halfway up, or at least pause. If it doesn't, you probably need a new O-ring (available at any hardware store).

c. Be sure to allow 5 seconds after the joint appears to be melted, before pressing the trigger.

8. HOT AIR GUN

This technique is not widely known but works very well and is quick. I stumbled on it myself and have heard from others who use it. It is my preferred technique when more than 16 pins need to be undone.

Method:

a. Mount the circuit board vertically in a vise so you can get to both sides of it.

b. Attach an IC puller (with rubber band around it for tension) to the IC to be removed.

c. Use a 1200-watt heat gun with a 1/2-inch orifice. Hold the heat gun 1/2 inch from the solder side of the board, sweeping the air stream from one end of the IC to the other. Heat for 30 seconds.

d. Pull the IC out.

e. Clean up the holes with copper braid if a new IC is to be installed.

Precautions:

a. Do not put a smaller nozzle on a hot-air gun than the manufacturer recommends. Nozzles smaller than 1/2 inch require thermostatic heat control to prevent overheating.

b. Do not heat longer than necessary.

c. Do not bend the board while it is hot; or if you do, straighten it while it is still hot (unless you like bent boards!).

d. Be alert for other small components that may come loose when the solder is melted. Be alert for droplets of solder that may occasionally be blown through to the component side.

Does the IC get too hot? Apparently not:

- Many ICs come out with some of the solder, higher up on their pins, still unmelted; that tells me they did not get as hot during desoldering as during original installation.

- My tests have shown that the IC case temperature never reaches 100 C; since ICs are rated to work at 80 C, that seems acceptable.

- ICs are rated to have 330 C on each pin for 10 seconds during installation; with my technique, the pins probably never get that hot, because solder melts at 200 C and the IC is removed as soon as that happens.

- Paper labels on the board, even right under the IC, are not scorched.

9. VACUUM BULB DESOLDERING IRON

Although a real time-saver with single-sided board, my vacuum-bulb iron (Weller DS-40) just doesn't seem to be up to the task with multilayer boards unless supplemented by other methods, such as copper braid.

The main challenges are:

- Heat transfer is difficult. Make sure the tip is well matched to the size of the pad on the PC board and is clean (inside and out) and well tinned.

- PC board traces tend to lift during the prolonged heating that is necessary.

Actually, this may indicate that the DS-40 is running too cool. (It's easier to overheat a board with an iron that is too cool than with one that is too hot.) I may try raising its working temperature with a Variac and see what happens.

50.4 is the AM calling/working freq on 6mtrs....still some activity there
when the band is open....

Not sure about 2mtrs...havent heard of any 2mtr AM in years...

As for antennas, horizontal is used on AM style modes (AM/SSB, etc) while
FM uses vertical...thats is mostly true on all bands from 10mtrs and
up...but if the band is open, a vettical on 6AM will work just fine...
If you want to use a horiz antenna, a squalo (square halo) or turnstile
or similar would be best (omni directional)...

For absolute accuracy the clear choice(of those you gave) is to
use the LORAN signal.

I use a 1 MHz oscillator and a devider chain to get a pulse at the same
rate as the LORAN in my area. I use the pulse to sample the phase
of a cycle in the LORAN pulse. I use that infor to stear my 1 MHz
oscillator.
My system has some drift due to drift in the analog phase sampler
so my accuracy (1 to 2 hour period) is limited to about 10E-10

3888. Variable-length ladderline tuner: implementation issues

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-17 00:00:00 UTC
From: psoper@encore.com
Message-ID: <Dt5H5B.J6A@encore.com>
Source record: 104614
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

I got no responses to my recent posting about how to design the
R/C circuit for damping relay coils as they are de-energized.
The Sams' Radio Engineering book rates a series resistor/capacitor
circuit as third in effectiveness after a single diode or back to
back diode pair for controlling high voltage as the relay coil field
collapses. I'm concerned that the diode route might get me into
trouble with nearby RF fields (i.e. as a nonlinear element and
thus potential RFI source), but 'm not savvy enough to chose the R/C
values for my relays (12 volt, 400 ohm coils), thus the posting.

My concern is that each time I flip off a relay as I switch the
tuner a noise spike will be induced into the nearby ladder line,
attempting to break my eardrums. Perhaps this is a non-issue?
Anyway, I'll go the empirical route and test for receiver "pops"
after wiring up the first relay.

This device I'm building is an array of seven relays spaced three inches
apart on a strip of lucite. Loops of 300 ohm ladder line of larger
and larger dimensions are switched in or out of the transmission
line connection between an antenna and the transceiver (via a 4:1 balun
and variable capacitor). The initial loops will run out from the
end of their relays and be held apart with more bits of lucite or PVC
while the longer loops will go up and around the back side of the
shack, held in place with insulated standoffs.

The goal is to arrange a 200 ohm resistive load at the balun to get an
effective match with low losses. This project is my best guess about
how to implement the tuner that Cecil Moore dreamed up and has alluded
to in frequent postings to the antenna group.

But the devil is in the details, and I'm now quite concerned that
my chances of maintaining balance with all the interconnects among
the relays will be poor. I'm wondering if (assuming imbalance),
I might tweak the length of one side of one piece of ladder line
to regain proper phase relationships? Would a dual trace scope
connected to each side of the line show me lack of balance and
allow this adjustment, preventing radiation from the ladder line run
from the tuner to the balun (i.e. at the operating postition)?
Again, I'll initially simply hook the tuner up and see if I have
RF in the shack, but I'm trying to anticipate how to handle this
if it is an issue.

Oh, another devilish detail came when I tried to connect the ladder
line to the relay wiper contacts. I removed the internal wires
connecting the wipers to the connector pins on the other end of

the relay, figuring this would be hopeless from a balance point of view. So now the ladder line loops comes in the end of the relay, in line quite nicely with the two pairs of wiper arms. I cut slots in the plastic relay covers to allow the ladder line in while expecting to be able to seal the slot with coax-seal after everthing was sorted out. But it turned out there still wasn't clearance for the ladder line to pass through, so I had to abandon the plastic covers. So now I have seven "open frame" relays that are going to be sitting under the floor of the end of my shack, effectively outdoors. I'm now scheming some way to keep dust and insects out of the contacts! A bit of Saran Wrap (cling film) is the only idea I have so far.

Pardon me if this sounds idiotic (or IS idiotic!). I knew nothing about RF just a few months back and am learning as quickly as I can.

Regards,
Pete

Hi Pete, I didn't see your posting. What was the subject? Are you sure it got posted? What I have done is drive the relay with double the rated voltage with a resistor in series equal to the coil resistance and a 0.1 pf cap across the coil.

: My concern is that each time I flip off a relay as I switch the
: tuner a noise spike will be induced into the nearby ladder line,

I wouldn't recommend switching the relays with RF on them. What I do is switch the relays without RF on them, then apply RF and write down the results. From then on, simply consult the chart and preset the relay position depending on frequency.

: Again, I'll initially simply hook the tuner up and see if I have
: RF in the shack, but I'm trying to anticipate how to handle this
: if it is an issue.

I try not to anticipate problems but solve them as they arrise. Quite often an anticipated problem never occurs.

: Oh, another devilish detail came when I tried to connect the ladder
: line to the relay wiper contacts. I removed the internal wires
: connecting the wipers to the connector pins on the other end of
: the relay, figuring this would be hopeless from a balance point of
: view. So now the ladder line loops comes in the end of the relay,

: the ladder line to pass through, so I had to abandon the plastic
: covers.

I kept the covers, brought the common wires out holes in the covers and fastened them to the ladder-line outside the relay cover. I found that trying to solder the ladder-line to the common moving arms caused the relay electro-mechanical sensitivity to change for the worse. I used a glue gun to seal the holes.

Hi!

I've been having gobs of fun playing with PIC microcontrollers now
that I've got CCS's C compiler. :-) Am I a happy camper, or what?

Anyway, I'm thinking of making a "fist-straightener"... The general idea
is to take my striaght-keyed input and turn it into machine-perfect 3-to-1
"dah"s and "dit"s at whatever overall speed I'm sending out. It could
even snap the silent spaces to the same time grid.

Has anyone heard of such a thing already existing?

I'd like opinions on how use{ful,less} such a thing might be.

Once I've coded and tried it, I'll let the newsgroup know how it went.
(Of course, I'll make the source code available too.)

Congratulations, Dennie! I applaud your decision, but I urge you to exercise some caution...

I operate nothing but QRP CW, and have been this way for many years. It is a very satisfying facet of the hobby, and it's not for everyone.

As for novice QRP rigs, I am not a big fan of the idea, and I'll explain why. For most novices, the code is a new experience, and probably a bit difficult for them. This puts them at a distinct disadvantage. Operating with the typical QRP rig, with very low power on transmit and often a less than ideal receiver, the disadvantage is many times greater. It makes an already difficult situation into a huge ordeal. Of course, using one of the modern HF rigs with the transmitter power cranked down (as I often do with my new TS-870S), the operator can take advantage of the better receiver and other features. But the low-power disadvantage is still there. The person on the other end is likely to be a novice also, and he/she will have a lot of trouble digging that weak signal out of the noise, in addition to having a potentially difficult time just copying the code. I'm just not a fan of the beginner starting out on today's noisy, crowded HF bands with low power and a compromise receiver.

Yeah, I know, in the old days, we used some really junky receivers that drifted and had no selectivity, and we were crystal-bound and limited to 75 Watts DC input. But remember, the bands were not nearly as crowded, and the man-made noise levels were far, far lower than they are today, with all of the RF-dirty consumer electronic devices polluting the radio spectrum practically from DC to light. Think about it.

I recommend, in most cases, that the novice start out with 50 to 100 W and a good receiver, get used to working CW and get good at it, and then ease into QRP, learning the ropes slowly as he/she goes.

This is my humble opinion, which may be wrong to some of you readers. Flame me privately, if you feel some burnign need to do so.

You are correct on the above. Modifying ham gear to work CB is a no-no!

>As far as Mark's question, I have an old Uniden Cobra 148 that I've been
>wanting to convert to 10M. They're readily available and the schematics

>think it's reasonable to do it with this radio. It only outputs 5 watts
>(all the cheaper CBs will put out around 3 watts), so it will be my QRP
>radio in a couple of years when 10m opens up.

Bill, I have converted literally DOZENS of CB rigs to 10m over the past
19 years I've been a ham. Never once have I found a need to modify the
RF section (or any other section) to make it perform 100 percent on 10m.
You'd be surprised at how broad-banded these things are, and how far you
can tune 'em with very little effort. Most can be tuned for anything
from 22 to 30+ MHz. I've helped friends convert CBs to 12 meters (that's
24.9 MHz for those who didn't know) and only a re-tune was required to
make 'em work (plus the usual crystal changes, of course). Also, what-
ever the power output was on 11m, it will be on 10m. A typical SSB CB
rig will put out between 10 and 15 Watts PEP, and it will do the same
after 10m conversion. If your Cobra 148 is only putting out 5 Watts on
SSB, it either desparately needs alignment, or something's wrong with
the transmitter section, or perhaps both.

You'll be pleased with the Cobra 148's performance on 10m. I ran one
for several months during the last sunspot cycle, and I worked all over
the world with it.

OK ran out of space in the first post,
I forgot to mention three things:

0. You are probably not going to be able to reprogarm the cell phone CPU,
so scrap the phone for parts. TV tuner plls and prescalers are a few
dollars each new so why bother?

1 getting cell phone VCO modules working:

take a ohm meter, find the two leads on the VCO that show
some DC resistance, theses should be power and ground.
Start with a five volt power supply, and a frequency counter and
a six inch piece of wire, the ground lead is usually shorted to the metal case,
the 5 volts is low enought that you wont blow anything. go through all
the possible combinations of DC in, ground, and RF out. One other lead will
be the varacter, and these need 1.2 to 30 volts generally, Use the 6 inch piece of
wire soldered each lead as a antenna to couple to the counter.

Mini Circuits labs sells a range of VCOs from 2Mhz to 2000 Mhz, usually at say
16 dollars each, if your cell phone has the VCO as discretes on the board.

2. The amplifers usually run off seven volts DC at say a amp,
they usually need a bias voltage applied through a choke that
blocks 900 MHZ, applied to the RF input lead. Note that you can find the
RFin RFOUT leads usually at the left and right respectfully with ground and
VCC leads mixed inbetween. The bias voltage is usually adjustable from
0 to say 3.2 volts, more then that blows the amp. They will feed back and oscillate
if not heatsinked in wired properly so observe how the amp was mounted in the phone.

Hope this helps some one do a cell to 900 conversion,

Steve Roberts, N8vkd.

3899. Re: Cell Phones as 23cm HAM Radios??

Source record: 104625

> Regarding the post on cell phone conversion
to 23 cm, I've bought several units with that
idea in mind. Unfortunately while they are great
sources of RF parts and have a nice 7 watt
amp module, (in the larger units) the VCOs
in the phase lock loop are for low side injection and
I've found with some experimentation that they usually
range from 730-854 Mhz. Most cell phones do not use a
standard off the shelf phase lock loop chip that you can
get docs for. What I did find interesting was
using a cheap CMOS TV tuner chip, the vcos from the cell phone
and a NTE 851 series TV tuner prescaler and a simple low pass filter,
a recent microwave column in 73 magazine had a good example of how to do
this only using a TV tuner lo as the VCO. Some older cell phones,
(the big Rola underseat monsters) have a neat 45 Mhz IF board, and by
mixing the cell phone VCO with 100 Mhz, you could make a nice unit,
by scavenging the phone for parts, but the newer units have fixed ceramic
filters that will not let you go out of band. Older base station units have
a 900 mhz capable tuned cavity filter that was quite useful and went right to 922.

Some really old phones use a 380 to 432 mhz oscillator module, and this
ran into a doubler module. This worked quite well when the 432 module was replaced
by a biz band rig programmed for 450 and up

The power amps use a few milliwatts of RF in and if you derate them from their
7 watt power rating they go right up to say two watts at 900. They need a dc bias to set
power, email me for details.

3907. Need help - HW101 problems

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-18 00:00:00 UTC
From: jwg6@cornell.edu
Message-ID: <jwg6-1806960643510001@cu-dialup-0809.cit.cornell.edu>
Source record: 104535

I just inherited a Heath HW101 which I've cleaned up; it receives well but I'm having considerable trouble with the transmitter. Unfortunately I have no manual. Can anyone lend some advice toward troubleshooting this rig?

1. Can't load up transmitter. When in "tune" mode, I get virtually no meter reading, no matter what I do with the final and load controls. I replaced the 6146's but made no difference. If I connect a swr/power meter to the output/ant I can get a 1/4 scale reading, but only if the sensitivity on the meter is turned all the way up. So it must be less than a watt or two that I'm getting, max.

2. With key connected, there is no activation of transmitter in CW mode. All I get are some faint clicks from the speaker when key opens and closes. No tripping of relay, receiver doesn't even go quiet, no rf output. No sidetone generated either. If I key microphone, however, the relay kicks in and receiver mutes properly - no tx rf tho'.

3. Can't find any sidetone adjustment - is it on a board somewhere?

I have poked around with a probe (insulated) and it appears all tubes are connecting okay. ANY ideas or advice would be great, many thanks, N1AEP

Mike : Great post. You've clearly outlined the important stuff. Wish I could have read that a few years ago! I've never worked with hot air, mostly because of a concern for the normal lack of control. But I just ordered a Pace Thermojet (for soldering only, really)

>NOTES ON DESOLDERING

>WHICH TECHNIQUE IS BEST? I use the hot air gun for ICs with 16 pins or

> have melted through any protective coating on the surface that would
> otherwise interfere with heat transfer.

I think an important factor here is that as it ages, solder oxidizes, and the oxidized solder doesn't flow. Adding new solder dilutes the mix, and breaks up the micro-chunks.

>a. Don't be shy about letting the tip of the Soldapullt touch the tip
> of the soldering iron. It's unavoidable, and so long as the area of
> contact is not large, it doesn't do any harm.

For this reason, I used to apply heat on the component side, and suck from the bottom. But these days, we use heated solder suckers.

>Does the IC get too hot? Apparently not:

> - Many ICs come out with some of the solder, higher up on their pins,
> still unmelted; that tells me they did not get as hot during
> desoldering as during original installation.

Again, some of this may be oxidized solder. But I think that with your experience, you're probably controlling the heat and the chips are OK.

Hi Tom,

The circuit needs to supply 180 degree external phase shift, most circuits that I've seen are pretty broad in phase shift and usually have a basic low pass or high pass design. That makes the oscillator pretty unstable. The way around this is a series tuned link coupled tuned circuit.

MMIC's have a low input and output impedance, complicating the external circuit. They load the external circuit heavily.

MMIC's require external current limiting, and that aggravates temperature related drift. You just can't feed them from a voltage regulated supply, there has to be current limiting after the voltage regulator. When MMIC temperature changes, the thing drifts.

MMIC's have a lot of internal negative feedback, and don't saturate or AGC well. That makes a MMIC oscillator a bit fussy about feedback level, and prone to parasitics and a bit dirty. The way around that is to add an external limiter or AGC in the feedback loop.

Other than that, they work.

> The beast you want is known as a Acousto OPtic Modulator, its a
chunk of quartz with a piezo transducer bonded to it and driven by a
few watts of RF, it produces a defraction grating in the crystal and
by setting angle of the laser beam very carefully with respect to the crystal you can
either AM or ON/OFF modulate the beam of the laser. This is a off the shelf
device and sells for say $200 used and complete with driver module,
I'd go digital using a codec and on/off modulate the beam with the digital code.
LCD shutters are not fast enough for your application as suggested in the previous post.
7 miles is a long way and you will need a columnating telescope to expand the beam
and reduce its divergence.The book you want to check out is titled Laser Experimenters
Cookbook,
88 ways to use a laser. You are probably better off with a RF link,
especially if you have a lot of snow or rain. I do laser lightshows and its
hard to get a beam to hit something and stay there at 7 miles as the beam acts as
a optical lever.

Surplus AOMs are available from many laser surplus companies on the net,
good luck.

Hello Pete:

Just use a diode across the relay coils to attenuate the relays
de-energized reverse voltage pulse, and if you think that local RF will
effect the relays just add a 1000 pf disc capacitor across the doide, it
really shouldn't be bothered by local RF energy if you have a reasonable
SWR.

That's a lot to consider. Better bet to stick with the FETs. I was
hoping to use them as power oscillators for a 100mW QRP project. Do you
think that they would be superior in this particular application?

The subject was something like "making relays quiet" and I didn't wait long as I'm running short of time. I'm not sure of anything to do with my Usenet feed. When I get other's postings, in random time order or any order at all I count myself lucky. You and many others can treat Usenet as a conversational device with a few hours or day delay our thereabouts, while for me it's like the Liberian Postal Service.

>double the rated voltage with a resistor in series equal to the
>coil resistance and a 0.1 pf cap across the coil.

Well that's another combination I wasn't aware of. I'll assume you meant .1uf. So the shunt resistor provides snubbing action? I assume the capacitor looks like a short to RF?

>>: My concern is that each time I flip off a relay as I switch the
>>: tuner a noise spike will be induced into the nearby ladder line,

>I wouldn't recommend switching the relays with RF on them. What I
>do is switch the relays without RF on them, then apply RF and write

I didn't mean to imply I'd be switching the relays with transmit power applied. I'll never do that intentionally.

Say I'm listening to my receiver, hooked via the tuner to an antenna. It's time to change bands or whatever, so I deenergize one of the relays of the tuner to switch the length of ladder line present. As the relay coil's field collapses a back EMF potential of a few hundred volts appears and gets coupled into the ladder line path to my receiver via the coil's ground return line and from there ends up in my eardrums. This is my first concern. The second is that I want to replace the mechanical switches controlling the relays with logic operated devices in the future and I'm sure they won't want to see high potentials coming at them. The last concern was RF flowing through a rectifier (either part of a snubber or an indicator LED). If you say all or part of this is a non-issue, fine, that's exactly what I'm looking for.

>I try not to anticipate problems but solve them as they arrise.
>Quite often an anticipated problem never occurs.

Granted, but trying to figure out what could happen and what I would do about it is part of my personality and the way I learn about things in depth. Different strokes, heh?

>I kept the covers, brought the common wires out holes in the covers
>and fastened them to the ladder-line outside the relay cover. I found
>that trying to solder the ladder-line to the common moving arms
>caused the relay electro-mechanical sensitivity to change for the worse.
>I used a glue gun to seal the holes.

This is a key point and has saved me horrible grief. This would have dawned on me (like a load of bricks) as I was finishing the first solder joint (duh). Limber but well-dressed wires of the right gauge and spacing "coming up". I'll put some more lucite supports in place and run the "relay interconnect" ladder line along one side with breaks adjacent to each relay and tie the limber wires across to each side of each break. This should actually be a great deal cleaner than what I was going to do. And it seems that this kind of interconnect would be better for the loops too, as running the ladder line loops right to the relay's end terminals is looking to be very messy. (In my posting I incorrectly described the loops being on the moving arms, which of course they are not).

So if I had it to do over again, I'd cut the moving arm wires at the relay connector and thread them through small holes in the end of the relay's cover, sealing them with a little blob of coax-seal (not glue, which is irreversible).

It looks like I should have started with a U-shaped channel of three rectangular lucite strips cemented together. The middle would hold the relays while the others would run on either side of the row, holding the ladder line connections. Power and ground could come in from below the relays to be at right angles to the ladder line and "limber interconnect" wire pairs. Then the whole thing would be mounted on one side so the short loops could hang down.

By direct mail Jay (jay123a@ptw.com) suggested a rectifier diode in parallel with a 1000pf cap across the relay coils, saying this should prevent RF from interacting with the relay. And Brian Olliver () suggested .1uf in series with 33 ohms across the coil as a "snubber".

Thanks to all.

Regards,
Pete

They load the external circuit with ~50 ohms. You design
the external circuit matching to be compatible with this.

In my experience, MMIC's have less change in the phase of S21 than
transistors. This results in less temperature drift.

FET's make sense in certain oscillator configurations, but the best
bipolar transistor and MMIC oscillators have lower phase noise and
higher temperature stability than the best FET oscillators. It is
interesting to note that one almost never sees papers at the Frequency
Control Symposium about FET oscillators. Of course, we could all
be wrong.

Great topic - not talked about much. Ive had QSL cards that could not be written on because of the finish. Ink would just rub off. The same card could not be posted as a post card because the machinery would destroy the picture.

My next card design will be computer friendly. Ill print a nice picture on one side and used the other for mailing address and contact information. Ill put my call on both sides.

I'm not sure if 140x90mm is standard QSL card size but many homebrew cards are not and that can be a problem when sending for an award or keeping in a file. Ive had to cut some cards down to keep in my file.

They were easier to find when tubes were in use... You could do a search on
"socket extenders" for tube testers... Or else get small nails (cut the heads off) into
a socket, stick it into a piece of foam core, and use this as a form for epoxy.
I still have a plug I made for a Grundig Satellit I wanted to make an adaptor for...

It takes a fair amount of work removing capacitors and turns on some of
the coils in the RF tx & receive sections but I've successfully
converted a SSB CB to 50 MHZ (as in 6 meters), and even worked another
ham several hundred miles away also running a converted CB!
Same transistors all around, only tuning changes done.

Perhaps he was using a typical power meter when reading the voice power
level and not realizing that, even with a sustained whistle into the
mike, the true PEP power level is usually close to twice the reading of,
say, my Bird 43 power meter reading.

I'm a former 6M AM fanatick but even 15 or so years ago AM activity had
dwindled to such scarcity I was forced to build a transverter for SSB
for my HF transceiver so I could talk to all the "quackers" I could hear
in my AM speaker but could not raise using only AM.
> Regarding antennas, would a ground plane or horizontally polarized antenna

> understand, antennas for weak-signal ssb/CW are horizontally polarized;
I ran both vertical and horizontal in my 6 Meter AM days; could never
tell much difference when working DX. When working local stations the
polarization will make a BIG difference. Usually 6 meter operators only
get on when the band is open or when a local net is on so it might be
hard to find out what the favorite local polarization scheme is
depending on where you are.

As best as I can tell, many of the QRP kits *will* allow you to run
on novice segments. I just built an Explorer II from Oak Hills Research
and it could be made to tune any 70 kHz segment within the 40m CW band.
It just depends where you center the VFO.

Check out the June issue of QST. They review 5 QRP kits. It's a great
article! I just saw some of the kits sold by Wilderness Radio (415)
494-3806 such as the Sierra QRP and the NorCal 40A and was quite
impressed. These are really sharp looking radios. The boards are works
of art. They'll do the novice segments too!

You might try Antique Elecronics Supply. I believe they are in Tempe AZ.
A web search on vintage radio would probably find them.

> ==========response GM0CSZ / KN6WH
Juan , 1) Take an old seven pin miniature tube

2) Wrap Cellotape around lower 1/2 inch part near pins

3) Safety first : put thin gloves on and safety goggles(=eye
protection)

4) Gently scratch glass (with glass cut scrathcer) all around
at cellotape edge

5) Gently tap top of tube ----> it will come off

6) Carefully remove 'guts' from tube but leave inside pin stumps

7) Solder wires/cable to pin stumps and check continuity
between wire/cable end and relevant pins, if necessary use
sleeving over solder joints and pin stumps

8) Fill the now glass envelope plug with 2 components epoxy
adhesive

9) After adhesive has hardended , remove cellotape and slide
heat shrink sleeve over plug .

10) Finally very gently heat sleeve and presto ,your wire
bundle or cable with its molded plug is ready for use.

Success !

I have not been happy with a vertical on 6 Meter SSB, even during band openings. Sometimes it makes no difference but often I can receive better with a 40 meter dipole at 30 feet than the ringo ranger at 55 feet. Go for the squalo or a small beam.

Has anyone with an RCI2950 seen instability and distortion on both receive and transmit
when the radio gets hot? i.e. - inside a parked car on a hot day? Mine starts to sound like
the signals are being filtered through a waterfall - a 'burble' sound. The radio has been
back for a complete alignment (which helped performance but not the temperature problem).

Also - does anyone know of any mods (not the typical CB freq mods) that will improve
FM reception, ANL and noise blanker, etc??? - Also, a pictorial with pots and coils marked
would be a real help.

<Fault descriptions snipped>

Joel,

It's many moons since I fault-found one of these but it sounds like a problem a local amateur around here experienced. We traced this to low output from (IIRC) the mic amp (which I think the CW tone oscillator also feeds?). The tube was a double trode (12AU7 or 12AT7) and the plate resistors had gone high on both triodes. It's a long shot but after all these years you might find that the resistors are worth checking, same goes for the decoupling capacitors. BTW, I think the pot to adjust the sidetone was underneath, accessible thru' a set of holes.

I am trying to find a source for the National Semiconductor LM1863 AM (Radio System for Electronically Tuned Radios). I would like to use this part for a current project, but I cannot find one. The part is on lifetime but, which means the part will be obsolete soon. National does not have any in stock and nither do the major distributors (Hamilton-Hallmark, Future, Zeus). Can anyone recommend another possible source or do you have a few extra parts you want to sell?

Any help would be much appreciated.

Computer disk drives has lots of reusable surface mount parts. Go to a computer repair store, and beg or buy a defective hard disk drive. Don't pay more than $5, as these things are not repairable! All they can do is throw them away. Inspect the pcb to make sure that it actually has surface mount components as some old drives pre-date surface mount. At my place of employment, where everyone has a computer, a bad disk drive comes up every few months or so.

I used to use a soldering iron to remove the sm (surface mount) capacitors, but not any more. Just use a heat gun for about 5 seconds, and then slap the board down on the table, and zillions of sm parts fly off the board. I belive that all the sm parts can survive this kind of heat and more.

Hello Bill,

B ->I think you sent this to the wrong person. I'm glad to get this, though,
>as I am involved in RACES/ARES and it did explain some things I wasn't
>aware of. Such as the congestation on the telephone lines being more of
>a problem than power outage.

Sorry, don't know how that happened with a reply. I hope it wasn't
private so the intended could read the message. Especially since some
idiot erased it from his hard drive.

B ->My actual reply to the person who posted the stuff you commented about was
>simply the line below:

B ->"Check out this Spring in Northern Idaho."

B ->Up there they thought they'd be OK, everything was on cellular phones.
>Guess what? The cell phone transmitters got knocked out when the power
>went. :-) And most of the phone lines were down as well. So they were
>glad to have hams. And it did cover an area the size he said he hadn't
>seen covered.

In a hurricane or severe windstorm those marvelous lowest bidder
cell towners will come tumbling down too. Try using a 300mW to reach a
cell site 2 miles away on the ground!

B ->I'm deaf, so some areas of knowledge didn't interest me much until recently

>Now about your specifics, if you don't mind explaining them. I've never
>had problems calling my mom on Mother's Day. :-)

How nice not to have to talk to your mother-in-law every year!!!
<Grin> For those of us with that stone around our neck, hours can be
spent trying to get through. Mother's Day is the heaviest service day
the phone companies experience.

B ->Don't the phones need electrical power to work? I know that when power in
>my house goes out, the phone still works, but not if it works both ways:
>I know we can call the power company and tell them, but can people also
>call in to us? I'd assume not, the ringer wouldn't work?

The phones (except cordless) will still work, the dialing and
ringing power is provided from the plant (central exchange) and they
have backup batteries (truck batteries with a pituitary problem) and
generators to provide power when commercial power fails.

B ->Also, if the power is out like it was up there this Spring, won't that also
>shut down the phone central exchange for the town?

No. The exchange should have adequate batteries for hours of backup,
even if the generators fail.

B ->Assuming it had a generator, wouldn't that still cause problems to
>phone service, beyond the media and panicked folks trying to check
>on friends and relatives,

Not the power outage beyond scared people loading up the system. See
my explaination below.

>...let alone the politicos using the interruption setup you
>described (should'veknown the gov't would have something like that
>in place! ;-) to check on their local fund-raising drive during the
>emergency ("Did you get them checks cashed? No? Get it done now!")
>(Yeah, I'm pretty pissed off at my local politicos right now. Sorry.)

No, that's the problem, the local authorities don't have a priority
or flash overide system. That's why alternate means of communication are
needed. If they could override non-urgent calls in a disater then things
would get done. (Including making a lot of disconnected callers mad.)
Some of the federal (closed) systems and military (closed) systems have
that capability. (By closed I mean not accessable to the public.)

B ->I hope you won't mind answering these as I'm really curious about this gap
>in my communications knowledge.

Not at all, just in case the person I was trying to answer didn't
see the last message, I'll be a little redundant. The problem is not
power to the communications systems, it's overload of those systems.
When cable installations are planned the company looks at current and
reasonable projected needs (ie is a mall or office building planned
during the expected life of the cable. The local automated exchanges
(those cute fiberglass telephone company outhouses you see in suburban
and rural areas) are planned on the same basis. In a rural town of 1000
customers, they may project that 2% of the customers would be a normal
top load for people calling in or out of that exchange at the same time.
(I'm sure they use formulas that take into account businesses etc.) That
means there would be a need for 20 lines out of the exchange during an
expected heavy load. They would add a fudge factor for bad lines, etc.
of maybe 10% of that for a total of 22 lines. That works fine on most
days (except Mothers' Day, Christmas, and Easter when those of us who
try to call get a recording saying, "due to a heavy volume of calls your
call did not go through, please try again later." Of course everybody

else tries later too so the problem just gets worse.
Let a disaster hit, and everyone of those 1000 customers will be calling out, or have people calling in, all at once. The systme takes whoever is dialing at the time a line opens up.
Let's expand that to a city the size of LA. As the total number of subscribers goes up you can expect the ratio of outside line usage to decrease. (A larger number of calls will be local though, and that also overloads the system.) It doesn't take a rocket scientist to figure out that with a few million trying to call out, and several million trying to call in that things are going to grind to a halt.
That's why alternative means of communication are needed.

Jim KE4EDT/AA

3940. DDS devices for ham use

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-19 00:00:00 UTC
From: "Timothy Ressel", Non, HP, Unkn <tressel@metro.sr.hp.com>
Message-ID: <4qa37r$les@canyon.sr.hp.com>
Source record: 104481

There is growing interest in using Direct Digital Synthesis (DDS) for various ham applications, mostly VFO generation. Recent articles, including the one in QEX, expound on the virtues of DDS to the point of mild hyperbole. Well, I hate to rain on anyone's parade, but you hams may be thinking 'no free lunch' when reading about DDS, and you'd be correct.

First, DDS is a QUANTIZED synthesis, which means samples are spitting out of a DAC at some rate. In the case of the Analog Devices AD7008, samples come out at a 50MHz rate. This means a strong (-10 dBc) 50MHZ component at the output. Then there is the mirroring problem, which means for an output of n MHz, you also get an output at 50-n MHz. So a 24.5MHZ signal will have a signal at 25.5MHz. It gets worse. Because DDSs use a phase accumulator method, the number of discreet steps in the sine wave varies with frequency, but the sample rate (50 MHZ) does not. These to sample rates interact to create spurs. Lots of spurs. The amplitude of these spurs increase with the frequency of the DDS output. At 1MHz the spurs are -60dBc to -80dBc, while above 10MHz the spurs are -30dBc.

So this is clearly not paradise. However, if you stay below about 5MHZ and use a VCO in a phase-locked-loop arrangement, you can get a clean output at a higher frequency. My HF rig uses Mini-Circuits VCOs ($16.00!) to get a 45-75MHz 1st LO output for high-side injection to get a 45MHz IF.

I have used some QSLs in my ham life, now I'm using very simple cards
having only the minimal information necessary. It is the one you
cited above. There is no information about power, RX, TX, antenna, etc...
on my current card. If I have to add it in a special case, I can because
there is enough blank space left for comments.

If your QSL is good for some diplomes and when the callsign is not
sufficient to show the possible assignment, then you should include
this information, e.g. the county, the DOK, the QTH-locator, etc...

Use only good readeable fonts, avoid old fashioned ones. They are not common to some peoples. Remember, the latin characters are foreign characters to many peoples.

Be clear with the date. Note that there are some different ways to write the date in numeric form around the world. Be clear. Avoid "5/7/96", use "May 7th, 1996" or " 7th May 1996" instead.

If the power is less than a watt, you can buy the transformer from Mini-Circuits for about 4$. And it is definitely going to work. I don't have there address or phone number. Email me if you are interested.

> use??

I'd vote for LORAN as a short term solution & GPS as a long term solution.

IMO NTSC colorburst signals could be used _provided_ that both sites used a common broadcast source and transmission path...if the two sites used different paths (cable vs. VHF air link, two independent cable providers, etc.) you may have some dispersions in frequency stability which may or may not be a problem. The use of two different broadcast stations, even if they are affilliates of the same network is a no-no; most broadcast stations resync all source material (including live network feeds) to their own master oscillator thus breaking the traceability back to the network.

WWV is perhaps not quite a reliable enough source for a good frequency standard due to propagation (NIST advertises an 'as received' frequency stability of 1E-7 even though the 'as transmitted' stability is 1E-11), and you ought to be getting several orders of magnitude better results from the LORAN chains.

Hi Peeps,

I'm wondering if I need one of these external type audio filter gizmos I see advertised...

I only use VHF SSB for "real" contacts (On packet rest of time) and wonder if these boxes will make life easier.

What actually can you get one do do ?

Can you filter out the hash, so you can have the vol up for those pesky weak signals without doing the few brain cells left in with all that noise ???

Can they even select one weak signal's voice from a pile of others ??

And can I make on myself not too expensively ???

Your comments/experiences gratefully received.

Although I am a few weeks shy of being ready to release it I have designed a low cost 9600 bps TNC and modem -- free to all. It will be released as schematics and PCB layouts. The TNC is Z80 based, and the modem uses a FX589 from CML. It is at the working stage, but I want to run a couple of PCB's to check all the last minute changes.

I have taken a lot of effort to make this "producable" in the ham environment eg. very few unusual parts, non PTH PCB etc.

I will post where it will be available here when it is ready,

Tony,

Try Rochester Electronics. They specialize in old and obsolete parts.
As a matter of fact, their "tagline" is "manufacture and distribution of
trailing edge semiconductors."

Their number is 508-462-9332 (508-462-9512 fax). This was taken from a
'94 - '95 catalog.

Good luck.

Interesting. I haven't been involved with this in a few years but
the telcos DID have a different class of service for fire, police etc.

They didn't bump existing calls but did get preference when making
a call as I remember. Pending calls were put in a queue and there were
different queues for different classes of service.(I Think).
I had no reason to get into the details of how it was done.

Has anyone considered using stepping relays for switching the line segments?
4 x SPNT (N=# of segments + 1 for indexing)
A microcontroller could step until the index is found and then step to the
appropriate segment based on your lookup table.
Heck, you could generate a signal to crank the
RF down while stepping.

If anyone knows of some suitable relays.....

Even in australia it is widely known and incouraged for hams to build and
modify there
radio for use on the ham bands, even CB's!!!

This is what ham radio is all about!

3967. Cellphone to 23 CM

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-20 00:00:00 UTC
From: tkomljan@mobility.COM
Message-ID: <1996Jun20.084546.1540.94391@mailgate02.mobility.com>
Source record: 104495

As already established in this newsgroup, most cellphones cannot be mod'ed unless you are able to take over control of the synthesizer AND replace the 881 and 836 MHz ceramic filters.

Certain older phones, such as the GE TR-160, have 3 Murata Gigafil filters. One of them, in the synthesizer area, is a DFC2R926.... a 2 pole 926 MHz +/- 12.5 MHz filter. If you got a few of these old phones, you could swap this filter into the appropriate areas, such as the output PA section, and give it a try???

Of course, you still have a lot of digital interface work and junk ceramic filters to through away.

Just a thought..... no guarantee's of success.

3970. Help! No UHF UUMPH!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-20 00:00:00 UTC
From: Bill Meara <w.meara@codetel.net.do>
Message-ID: <4qcdlk$c8v@server2.codetel.net.do>
Source record: 104498

I may have told this sad story before, but my troubles persist, so here I go again:

I'm trying to get my Hamtronics XV4 transmitting converter running. It converts 28 Mhz to 435 Mhz. The oscillator section seems to be running fine, but instead of getting 1.5 watts out from the transmitter section, I think I'm only getting about 250 milliwatts. My test instuments arent the best - homebrew RF probe to a VTVM. The manual says that the unit should draw around 35O ma with key down from the driver - my amp meter shows only about 225 ma. This supports the reading that I'm getting from the VTVM and the probe: not enough power out. The driver transistor (with heat sink) heats up as it should. I've checked the DC voltages on all the transistors - they all look OK.

Any ideas?

Thanks Bill N2CQR/HI8

>tgunn@mbnet.mb.ca...
There's an article on this in the latest issue of CQ talking about the
Kantronics KPC96 being used to send Pages in the VHF and UHF bands
According to the woman I spoke to at Kantronics they recommend Motorola Bravo
pagers for conversion. They also sell them retuned to 2 meter or 70 cm band
They also have a book on doing it yerself which I've ordered but which was
unfortunately out of stock.

3973. Varian Tube JBXT 6975 From B52 Tailgun Radar

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-20 00:00:00 UTC
From: Steve Roberts <osteven@en.com>
Message-ID: <4qceum$2ci@antares.en.com>
Source record: 104501

Hello to all,

I have a tube that was a local oscillator in a B52 tail gun radar
assembly which my former employer bought as scrap. It is made by Varian,
has a waveguide flange on the side with a matching assebly, leads for the cathode
a top terminal with a HV lead, and a terminal on the side of the metal tube like
a ground lug. The tube is all metal construction and about three inchs long and maybe
9/16s at its widest, not counting the flange assembly. Has a bright red paint job and is in
mint condition

numbers on side of tube, JBXT 6975 (part number)
6426 67 (date code ?)
72H4

Two questions, what band is it, and how do I bias it for operation?
my guess is its a very tiny klystron or some form of exotic microwave oscillator,
any help would really be appreciated!! Please reply by email as well as
post as this newsgroup is rather hard to get from time to time.

The specs for Analog celluar phones indicate they use a 10Kb/second
Manchester coded data channel.
Has anyone used the same type of coding (all on one chip perhaps ?)
successfully on 2m or 70cm. I assume that they would be keeping banwidth
down to fit in the same bandwidth as a 'normal' celluar voice channel.

Hi name her is Nick and I hope you can help.

If you have a radio, any radio, that has a 600ohm mic input and you want to feed it with a mic element that is of a different resistance. How would you suggest going abt it?

The reason I ask is I have a Shure hand mic that the element seems to be around 15k ohm. I want to match it to a radio here that requires abt 600ohms. I can't seem to locate a matching transformer for 15k-600.

Is there any other way to do this?

Any help would be appreciated.

Tnx and 73

A friend of mine and I are working on a project using vcr multipliers. These consist of a small 900Mhz transmitter that hooks to your vcr and lets you put a receiver somewhere else in the house on another TV. GEMINI sold these and called them "Rabbits". You might have seen them in electronic catalogs a couple of years ago. Well it so happens that Wal-Mart has a smiliar device under the Popular Mechanics brand name. They call them "VCR Multipliers". Some Wal-Marts have sold out and I believe that they have been discountinued. The transmitter and receiver I bought was $29.00. They also had receivers on clearance for $8.00 each. You can find them back in the electronics section. If not there, then ask for the clearance isle. It's probably next to the layaway desk. The two units work in the 900Mhz amateur band. The receiver has a fine tuner on the back. With a little tuning inside, it could be centered into the amateur band. With believe with a little work, one could solder a so-239, bnc, or N-Connector into the back of each box and build a small beam. You would need to work up a tx/rx relay for the two units. Also, you would need to build a pre-amp and a small amplifier. I have been pretty busy lately though and have not had time to experiment with this. If you have any luck, let me know.

From: cfb@bga.com
Message-ID: <4qd8dp$13f8@news3.realtime.net>
Source record: 104507

Hi,

I am getting the bits together to build an 80M & 40M CW Xmitter (for when I get my novice & technician license/s). It is based on a 6LR8 TV sweep tube.

This tube is not too expensive and seems relatively easy to get. However, it has a 9 pin Novar base. Antique Electronic Supply doesn't have such a tube socket listed in their catalog. I have looked through other surplus catalogs, (Fair Radio Sales and All Electronics) but haven't seen such a socket.

Does anyone know where I could get such a beastie?

Thanks,

Chris (cfb@bga.com)

HI;

Thanks for reading this.
I have the following stuff for sale or trade. If it says it works,
it works and I'll replace or refund your money at my option should you
have any problems with it. However, please don't buy something and
then decide you don't need or want it and expect me to take it
back. Also If something says 'cond unknown' that means I don't
know if it works or not. and I won't guarantee it. Its as is.
If the price says quan for x dollars that means I will not sell them
in single quantities. (I'm lazy).
Alot of these boards are pulls from a big computer place out here
that went belly up. From the stuff I've pulled out and tested,
it appears that they went out of business because they were
throwing away good cards.

> I would check out the drive levels to the power transistor, also see
if your transistor is heatsinked well enough. Commom faults on UHF boards
include, bad trimmer or fixed caps having a value other then marked,
unnessacery lead lengths, proximity of the metal case to the circuit board,
stray coupling to a nearby object, or general missalignment.

You really need to evaluate your measuring instruments. The probe should be discarded and
a box made with a BNC connector or similar, with two 100 ohm surface mount resistors
in parallel going to chassis ground via a very short brass or copper strap.
with the feed for the diode detector coing off of this, you can measure
vary accurately down to very low powers with this, and you hand capacitence wont
detune the circuit this way. Details on how to build a excellent diode
detector that is accurate are available in the TECH library at WWW.Wenzel.com
which includes a calibration chart.

Does anyone know of any kits/plans/directions for the construction of microwave gear? I'd like to start out with a simple wideband voice link using a horn and dish, and progress to maybe a 10GHz data link. I have seen the project in the 1994 ARRL Handbook, and think it might be a little too complicated to start with. Any help along these lines will be GREATLY appreciated.

It would be nice to not have to carry around a big laptop computer on
camping trips. If their is away by means of software for a built in TNC
into the organizer, then that would be excellent.
<

Well, I don't know about the wizard, but I know how to get an HP-48G
calculator up on packet, as well as the Apple Newton. The main thing
you need to be looking for on the wizard is a serial port, but I don't
think it has one, does it?

Last month's (or was it 2 months ago? Check your library) Scientific American had instructions on winding a large loopstick-type of antenna for VLF work, and I think it included schems for a reciever. Check it out...I'm considering building one of these with a friend who's an amateur meteorologist for lightning detection.

Source record: 104520

I'm interested in a combination 6 meter and 2 meter mobile antenna. However, at the price for commercially available gear, I'd end up spending about $80 US for the antenna, $70 US for the mount, and probably $80 US for the duplexer.

Has anyone ever homebuilt an antenna for these two bands, perhaps using a trap? If so, would you mind giving me some pointers / ideas for doing so? Thanks!

3993. Re: is mono minitor available on ATV ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-21 00:00:00 UTC
From: rkoblish@aol.com
Message-ID: <4qfdmj$pvh@newsbf02.news.aol.com>
Source record: 104521

I assume that you mean a monochrome TTL-input monitor as used with IBM PCs.
The Readers' Digest answer is No, it won't work. ATV uses standard NTSC video with 15.75 KHz horizontal sweep but the IBM monitor uses 17 or 18 KHz (I forget the exact value). Early monitors were not tolerant of variation from their design frequency and might be destroyed if you drove them at the wrong rate. Even if that were not so, the computer monitor takes logic levels for its input and requires separate video, intensity, horizontal, and vertical sync signals. You'd have to rework the video amplifier to make it analog (so you could see shades of grey) and build a sync separator.

You *can* use an Apple II monitor such as the Amdek Video 300 (NOT the 310, which is the IBM model as described above). I've seen them abandoned at hamfests 'cause nobody wanted them. Or else a TV receiver with a video input jack, a used surveillance monitor, etc.

You might find an older CGA monitor that is switchable between TTL-level and composite video input. I have a Zenith monitor that does this and I know that Sears sold one, too. The CGA spec used the same can rates as NTSC and was designed that way so it could be run into a video modulator so you could play games on your computer and see the output on your TV.

Unless you *really know what you're doing, don't try to add a video input jack to a TV receiver, as many of them have the chassis connected to one side of the power line and if you do something wrong such as put the plug into the wall the wrong way you could kill yourself or your equipment.

If you live nearby a local ATV'er or ATV repeater, try receiving the ATV directly with your receiver. A couple of ways to do this:

1. Using a new, inexpensive receiver with continuous tuning, try tuning below Channel 14 on the UHF band. Many of these sets will go far enough below 14 (which corresponds to 470..476 MHz) to pick up our local ATV repeater's output at 438..444 MHz. Some will even tune down to the input on 425..431!

2. Using an older varactor-tuned receiver (the kind that has a little knob that you turn to set the channel received by each clickstop), tune below 14 on the UHF band as per the above. These sets were really continuous-tuned with a dozen or so presets.

3. If you have a cable-ready TV or VCR, put its tuner in CABLE mode, then disconnect the cable and connect your antenna in its place. The output of our local ATV repeater corresponds to Cable channel 60 and is receivable this way.

4. If your local ATV repeater has an output in the 902..928 MHz amateur band, you might receive it using a Rabbit VCR Multiplier ahead of your TV. This band is shared among the Amateur service, Part 15 devices such as the Rabbit, and other Industrial, Scientific, and Medical (ISM) devices.

For further ATV info, our club (the Baltimore Radio Amateur Television Society) has a web site (with links to other ATV sites:
http://www.smart.net/~brats
Or email brats@smart.net

Hope this helps.

>Has anybody tried Morse code over an RTTY modem? Run an
>audio oscillator from the mark output? It's not RTTY
>and it's not CW. Is it legal?
>

The FCC used to require that RTTY transmissions (all transmissions,
not just RTTY) be ID'ed by either voice or Morse code. For F1 (FSK)
or F2 (AFSK) transmissions it was common to use the same mode
for the ID as for the RTTY. I am fairly sure it is still legal.

I only did it for identification purposes. Copying by ear is
a little difficult, so keying the audio oscillator might be
a good idea.

Sounds like your test bench is fine (unless you can afford more)....sounds
like you're making accurate measurements. I agree that you need to look
at the drive to the final section. The fact that you have heat like you
"should" makes me go "hmmmmmmm" but all other indications are that you
have a weak driver or the coupling between stages is out of tune or open.

4000. VSWR meter for UHF bands Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-22 00:00:00 UTC
From: cureton@minyos.its.rmit.EDU.AU
Message-ID: <4qgisc$45d@aggedor.rmit.EDU.AU>
Source record: 104430

Hi,
I'm looking for a scematic for a VSWR meter that will work into
the uhf bands up to 500Mhz. Most designs I have found only extend to the
30Mhz barrier. I have been thinking of modifying the directional coupler
of the tandem match directional wattmeter outlined in the ARRL handbook
but are unsure if transformers in this design would work very well at
such a high frequency.

How accurate are the VSWR meters that are made of simple stripline
construction?

Ultimatly I would like a meter that covers the 2 meter band as well as the
UHF CB band a bit below 500Mhz.

Thanks in advance

>be GREATLY appreciated.

The "standard" way to start out on 10 GHz has been with a pair of Gunnplexers. The cheap motion detector types (about $20) will work, though the Microwave Associates units are better. Advanced Receiver Research sells complete MA units, though they're a bit expensive (over $300 each). The major difference between the MA type and the motion detectors is that the former have a separate modulator varactor diode while the latter have to be modulated by varying the Gunn diode current. This allows the MA types to handle wider bandwidth modulations, such as video or high bandwidth data, while restricting the motion detector types to just voice or lower bandwidth data.

Due to the relatively poor frequency stability of Gunnplexers, WBFM with AFC is used. They are always setup in duplex links by offsetting one of the pair by the IF frequency from the other. Typically, 30 MHz has been chosen as the IF, so the two Gunnplexers will be offset 30 MHz from each other. However, the 10 GHz amateur band is wide (500 MHz), so a higher IF can be used. One cheap solution is to choose 100 MHz (or any other clear frequency in the FM broadcast band) as the IF and use a regular broadcast FM receiver as the IF.

One of the pair is allowed to free run while the other has the AFC voltage of the IF receiver brought out to drive its Gunnplexer. This forces the "slave" station to track the other station at the fixed IF offset. As I mentioned, operation is duplex. The Gunn source acts as both transmitter and LO for the station at the same time. This means you hear yourself as well as the other station in the IF receiver.

For modulation of the motion detector types, use an adjustable current regulator with the modulation superimposed on the adjustment terminal of the device. There are several 3-terminal regulators which can be used this way. For the MA types, just apply the modulation to the varactor diode. The hardest part of this project is combining the AFC voltage from the IF receiver of the slave station with the

modulation of the slave, and with a DC tuning voltage. An opamp summer works fine for this.

You do rough tuning of the units with their mechanical tuning screws, do fine tuning with the DC tuning voltage, then flip a switch to activate the AFC voltage on the slave when you hear the other station. That's it. The units should stay locked together from this point on and you should be able to work duplex. A more elegant method sweeps the DC tuning voltage until lock is achieved then transfers control of frequency automatically to the AFC.

Note, you need some way of measuring the 10 GHz frequency so that you stay inside the amateur band. A simple wavemeter is sufficient. You can make this (adapt a micrometer as the tuning plunger and scale), or scrounge one surplus, or borrow one from another amateur active on 10 GHz.

To measure the 10 GHz frequency, Set up the Gunnplexer to transmit
and measure the receive diode current. Put a sheet metal reflector
in front and move it towards and away from the Gunnplexer. You
should see the diode current go through minimum and maximum values.
The distance between minimum's is a half wave. If you move
the plate through many halfwaves you can average the measurements
and easily get into the 10GHz band.

I hope that description is clear.

Bill K7NOM

Yes, this is almost exactly what I have in mind. However, I don't have
any experience putting something like this together. I understand the
theory in practice here, I just don't think I can get from there to a
finished design. Does anybody have a pair of these already set up that
I could buy and take a look at for ideas, or a more detailed set of
plans? Thanks in advance for any help.

> I had no reason to get into the details of how it was done.
>

Yes, the cellular carriers have such a system. There is a 16-bit number
in your cellphone's memory, transmitted to the cell site when you make a
call, called your "priority code" or something - I don't have the documentation
with me. For "normal" phones, this is usually the last digit of your
MIN (your "phone number") the other possibilities, A-F are reserved for
other things, including the military, emergency services workers, etc.

The only problem with this is, the cellular operators have AFAIK never
used this feature to deny access to low-priority phones during an emergency.

4013. Homebrew Minature VHF Reciever For Use With Car Alarm?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-22 00:00:00 UTC
From: Nathan Odle <c670064@showme.missouri.edu>
Message-ID: <31CC9CE3.F25@showme.missouri.edu>
Source record: 104443

I posted a question about homebrew microwave equipment a short while back, and now here's *another* question regarding *another* project I've got going. What I have in mind here is a voice pager that one could hook up to a car alarm, using ham gear. Here's what I would do: have a circuit in the car (this is the easy part) that would watch the siren circuit, and if activated, do the following: close my mobile's PTT switch, play a short "Your alarm is going off" type of message with proper ID off of a voice chip similar to what Radio Shaft sells, and repeat for a specified time interval or until the alarm is disarmed. That part isn't too hard at all, but it's the actual reciever a person would have to carry with them that would be the tricky for me. What I'd ideally like to have is a miniature VHF reciever that would be tuned to wherever in the 2M band the bandplan allows for this kind of stuff. It would include built-in squelch and a mute button, and would fit into a standard pager case. Given the tools and construction techniques the homebrewer has (i.e. no teeny surface-mount techniques), is this possible? If it is, can someone point me to a kit or design that would work for this kind of thing? Even a miniature reciever ready-built that I could add the mute function to and repackage, and retune if necessary, would be fine. Thanks in advance for any help.

Hi all.

i was wondering if anyone had plans for a 2 meter FM rig and/or a 70cm
rig and/or a 6 meter rig.

if you do could you please e-mail them to me at
k.keslar@worldnet.att.net
thanks in advance.

4015. Tube CW TX circuit, Xformer and tube socket request

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-22 00:00:00 UTC
From: cfb@bga.com
Message-ID: <4qfok3$ddk@news3.realtime.net>
Source record: 104528
Cross-posted to: rec.radio.amateur.homebrew,rec.antiques.radio+phono,rec.tubes

As my questions seem to smear across the subjects of radio, ham and tubes, I hope you'll all grant me the licence to cross post this article to the three groups. If not, I apologise in advance for my error.

I have a 50W CW TX design based on the 6LR8 TV sweep tube. This is a combination triode oscillator and tetrode amplifier. The oscillator plate output is fed to the tetrode control grid via a capacitor.

The Morse is transmitted by having the Morse key in series with the cathode-ground circuit of the tetrode (with a low value capacitor across the key in order to declick it). The anode goes to B+ via a choke with the RF going also from the anode to a pi filter/resonator (and thence to the antenna). The advantage of this keying approach is that the triode oscillator is left running without interference and thus is quite stable.

I am not sure of the impedance of the tetrode under open key conditions, but I bet you'll get a really good kick if your finger finds its way between the open Morse key contacts (the B+ is between 200V and 400V).

I have never looked at a Morse key closely before. Are they designed to keep the HT safely away from the user, or is this an accident waiting to happen? BTW, the circuit will be isolated from the mains with a transformer (see below), so there's no chance of the user grounding the HT. Thus, it will be fine if the key body is at the chassis's ground potential.

Regarding the transformer - I need one with a primary of 110V and either a 300V CT to 400V CT secondary OR a 150V to 200V secondary without CT. It must be able to deliver 200mA. A separate 6.3V CT > 1A winding will be nice, but not essential.

I have looked in the Antique Electronic Supply catalog (very expensive) and Fair Radio sales catalog (they don't have quite what I need). In addition, I have looked in All Electronics, MECI, JDR, Parts Express and Digikey catalogs. They don't have transformers with this kind of rating. Does anyone here know where I might find such a device, but less than the $50 or so AES is asking?

Finally, to the tube socket - I have asked this question on the homebrew group, but I am repeating it here because of the cross posting to the other two groups.

The 6LR8 is a 9 pin Novar based tube. I have looked for a matching 9 pin Novar socket in the catalogs listed above, but to no avail. Does anyone know where I might find one of these?

Again, if I have erred in judgement cross posting this article, I apologise,

Cheers,

Chris (cfb@bga.com)

From: drranu@holly.ACNS.ColoState.EDU
Message-ID: <4qid2g$eg4@yuma.ACNS.ColoState.EDU>
Source record: 104446

I posted a week or two ago looking for a schematic for a simple
VLF receiver. Many responded, one (two really) emailed me the
McGreevy VLF Receiver schematic. I built it and it works! I
have heard so far "tweeks" and popping from lightning.
I first built it on a breadboard, but there was a lot of feedback
and other noises, so I threw it on perfboard and then mounted it
in an aluminum box. That got rid of all the problems.

If anyone else is looking for a VLF receiver design, check
Dejanews (http://www.dejanews.com) for McGreevy, or email
me and I will email the plans to you.

Thanks everyone!

I have used all three on 10 FM, converted CB's convert commercial rigs, and radios designed for 10FM. Converted CB's are the worse & a waste of a good radio.

Go get a old Mortac or Mastr Pro & use that. CB's have poor IF sections & low power. Leave the CB on it's intended freqs where it canbe of good use.

4031. 6M/2M dual band antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-24 00:00:00 UTC
From: mack@MAILS.IMED.COM
Message-ID: <9605248356.AA835631733@mails.imed.com>
Source record: 104459

Earl Needham in Clovis, NM asked about a combo 6M/2M mobile antenna.

Earl:
There is a commercially available dual band antenna from
Hustler. They just don't know they have a dual band antenna!!!
Buy a regular Hustler SF-2 2M 5/8 antenna. This antenna is
electrically 3/4 wavelength when you add in the loading coil at the
bottom. If you divide 150 MHz (close enough!) by 3 you get 50MHz.
Another way of saying that electrically this antenna is 1/4 at 6M and
3/4 at 2M. It is a little short on 6, but it *DOES* work. The only
down side is that it is vertically polarized. It *does* cost you a
little on 6M SSB but a halo is a lot more trouble and probably not
much better. No problem for 6M FM though.

All you need is a regular 3/8-24 threaded mount for a mount. *Any* CB
3/8-24 mount (or amateur mount) will work. The diplexor is just a
matter of designing a combo low pass/high pass filter and putting it
into a box. Due to the closeness of the bands, it may be a little
tricky to get working, but not terribly difficult. There was an
article in one of the Ham magazines in the past 3-4 years and I can't
remember which one that gave a diplexor schematic and construction for
a 146/432 diplexor. It would give you an idea of how to do one for
6M/2M. Hopefully, someone on the list has a better memory than me. I
think it was either 73 magazine or CQ.

Easiest way is to wind some turns on the core and measure the
inductance.

For a toroid the inductance is
mu * N-squared*Cros-sectional-area/length
The units are MKS - meters and meters-squared.
mu-nought is 4 * pi * 10^-7

If you can't measue the inductance directly, add a capacitor and make
it resonate. Use a scope and signal generator to determine the
resonant frequency.

It may take some experiemntation to home in on the value since cores
can be lossy at high frequencies. You may need to experiment with the
number of turns and resonating capacitor.

Also, note that this is a small signal measurement. The actual
effective mu is a function of the signal level and dc bias.

I picked up a couple of X band motion detector Gunns at a swapmeet in the spring and had no difficulty retuning them to our band. If you have nothing else available, you can use the old technique of measuring the wavelength by reflecting RF back into the feedhorn and observing mixer diode current. There is a good writeup in the RSGB book _Practical Transmitters for Novices_ that discusses this - and lots more, like how to build a simple modulator around a 7805. I'm using FM radios for IF rigs, tacked together an IF preamp and am dangerously close to being on 10 GHz WBFM. My budget for two stations (you have to build two to have somebody to talk to) was $CDN100. I'm coming in well under that.

Try the RSGB Microwave Handbook (volume 3). There is also a brief writeup on the subject in the ARRL UHF/Microwave Projects book.

Just in case anybody asks - the IF preamp uses a MAR6 and a MAR3 in a 50 ohm microstripline circuit, laid out with a felt pen, scotch tape, and guesswork. The coupling capacitors are 1 nF chip capacitors, and a 78M08 handles the power. In lieu of rivets or plated-through holes I drilled lots of holes in the board and soldered wires through to the ground plane. Most of the decoupling capacitors are 1 nF and .1 uF chip capacitors (use lots!); I salvaged some tantalum electrolytics from a junk cellphone to babysit the voltage regulator.

Don't let people try to tell you that WBFM is completely passe. After you play with voice, why not try ATV? Or data? These things are really really really simple to use. Don't be afraid!

==========response GM0CSZ / KN6WH

Nick , If your Shure mike is a dynamic type it is likely 500-1000 Ohms.
When the label says it is 15k Ohm ,it could be there is a transformer
inside the microphone housing. If that's the case , just bypass that
transformer and you are in business . Good Luck !

You can wind a few turns and measure the L but too complicated
if you don't have the equipment.

Check this site for toroid info and how to recognize them :)

Common Anode is the way to go! All you have to do is provide a path to ground to light the LEDs. Common cathode sucks, for large LED displays, because the chip has to DRIVE the LEDs. i.e. It has to have enough voltage to turn on the string of LEDs that make up one segment of the display.

I've seen this done at low frequencies with a pair of TTL Flip Flops
driven at twice the desired output frequency. You might be able
to do the same thing with ECL Flip Flops. I'm not sure if it would
work within your 1% tolerance though.

The Novatel ARC (Calgary) modified a batch of trunk-mount cell
phones for 9600 bps packet operation in the 902 MHz band. The
split freq. stuff was a godsend. Can you say "digital repeater?" :-)

The mods were not trivial. They rewrote the PROM code to do onboard
KISS, added a new computer interface, and wobbled the RF decks to
slide up to the proper frequency range. Fortunately, the mods
were done by the same gang that designed the radios in the first
place :-)

There aren't too many of these radio kicking around. I have a pair
sitting in the basement. A network of two isn't much fun :-(

rate communications. If nothing else, playing around with voice
can teach you about finding LOS paths--no trivial matter unless you
have distinctive landmarks or a manadnock type mountain (big peak
that sticks out like a sore thumb).

You might even experiment with cheap varactor diodes--I don't think
you need to use expensive devices packaged for waveguide installation.
Why not have a piece of circuit board across the guide which you can
solder ordinary parts to? Are there cheap diodes that work well
as X band varactors? Green LEDs?

For <=100KHz, you can use walking-ring counters as sine wave generators, and drive them with flip flops which are clocking on opposite edges of a master clock. Check out Don Lancaster's CMOS COOKBOOK for ideas.

I saw that you put a note on the local *.forsale newsgroup
offering to pick up orphan (dead) TVs.

I think this is a fine example of the ham ability to
scrounge good stuff for next to free, and should
be applauded by everybody who reads this group.
More of us need to recycle good stuff like you're doing.

You've done the right thing -- and it's
actually a LOT of fun to pull the good parts out
of TVs. Tho -- it's harder nowadays to build a complete
transmitter from a TV set than it used to be.

Hint -- if the TV has a UHF tuner, you can have a
lot of fun with that, and the balun core on the tuner
300 - 75 ohm transformer works FB for an input transformer
on a solid-state push-pull HF amplifier. And the
degaussing coil on the picture tube can sometimes
be converted into a long-wire or Beverage antenna.

Nathan,

This doesn't really answer your question, but it works for me. I picked
up a set of US Military Ground Motion Detector Set Model TRC-3A at a
hamfest several months ago. It transmits on 149.700mhz AM (I have seen
others on various VHF frequiencies-- a friend has a set that transmits
at 129mhz AM). My 2m can even pick it up at short distances. It cost me
$35.00. It uses 2 9volt batteries.

Anyway, the set usually comes with 4 transmitters and one reciever. The
on-off knob is also the sensitivity setting (1 - 5). I usually set mine
on "3", but the transmitters have some variation in their sensitivity
settings so you would have to play around with it.

When the vehicle is disturbed, it transmits a couple of beeps. If the disturbance continues, it continues to transmit. Cars going by will set it off but I usually only get a couple of beeps before it stops. Range of the signal is about 10 miles with a good reciever. I don't know how well the supplied reciever works as I set my scanner (PRO-2006) to the desired frequency and turn the volume up LOUD so it will wake me if my truck is being messed with.

You could incorporate the military set with a standard car alarm. I have no idea what the legalities of this transmitter is, but I'm not worrying about it.

I use it because it is cheap and effective. Your mileage may vary.

Good Luck!

John

Man and machine not working as one.
here is the text that should have transferred.
Although i own an OK vacuum assist desolder
station i prefer to use a hot-air paint stripper for
speed and effeciency.
I've been using this technique for five years
To speed the process i made an IC puller from
a large pair of circlip pliers with the tips forged/
joggled to give good purchase under the ends
of the IC.
Practising on an old TTL board should give
an extraction rate of about 1 every 2 seconds
For further info on this and adaptation to deal
with surface mount chippery please check

And frequency. Effective permeability also varies with frequency.

And be careful the test equipment doesn't load the circuit with uwanted strays. Scopes are bad at this, RF voltmeter probes are much better.

4059. Plausibility of constructing a decent SWL receiver?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-26 00:00:00 UTC
From: a.holloway@mail.utexas.edu
Message-ID: <4qppbe$s2d@geraldo.cc.utexas.edu>
Source record: 104388

Hi Everyone,

I'm not a ham, but I figured you guys would know the answer to some of my questions. Is it worthwhile to construct a 3-30 MHz receiver comparable to, say, a Drake SW-8? By worthwhile, I mean can I get schematics, parts, etc., for substantially less than a commercial unit? I realize this is a hopelessly open-ended question since I haven't given any indication of digital vs. analog signal conversion, what sort and number of filters desired, you name it. But I'm just testing the waters, just in case building my own is preferable to buying a receiver off the shelf.

Thanks,

Alan

4060. Question regarding RX/TX switching on 50 CW TX

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-26 00:00:00 UTC
From: cfb@bga.com
Message-ID: <4qqb92$12v0@news3.realtime.net>
Source record: 104389

I am working on the design for a 50W CW TX for 40M and 80M,
based on a 6LR8 TV sweep tube.

I wish to enable the RX to use the same antenna as the TX. I plan
on including a relay to switch the antenna center conducter from the
TX output to the center conducter of the RX input. In addition, the HT
will be disconnected from the TX circuit while in receive mode so as
to eliminate any interference from the TX local oscillator. The filament
supply will, of course, remain connected.

The chassis of the RX and TX will be joined via the shield of the RG8/U
cable connecting the RX to the TX as noted above. Both devices will
be isolated from the mains by transformers, of course.

My questions are these:

- Is this a practical thing to do? Are there any gotchas when using
normal, sturdy xPDT relays for this type of thing at the mentioned
power and frequency? Will the receiver be blown off the table on
transmission (or be deaf when switching back to RX mode)?

- Is it better to leave the RX antenna center conducter floating when
in TX mode, or should it be shorted to the chassis? Which will
result in less TX energy leaking into the receiver antenna?

Cheers and thanks in advance,

Chris.

One thing I suggest you stay away from: The Ramsey kits. I built one
for the 1.25M band, and found it to have a lot of (needless) design
flaws. It also has problems with a 5kHz spur in the synthesizer.

I wrote a letter to Ramsey back in about January, and have never recieved
a reply.

I had intended to use the radio mobile in my pickup, but it wouldn't bring
up the repeater from one mile away with the engine running (even though I
could get into the repeater from over 20 miles away with the engine shut off).
When connected to the same wire, an Alinco DJ-F1T, an Alinco DJ-580, a
Radio Shack HTX-202, or an Icom IC-706 have had no problems getting into
repeaters in their respective bands with the engine running. Only the Ramsey
has had problems. (It's been sitting in the garage for several months now
as I lack time to fiddle with it further [the radio, not the truck].)

My only connection with Ramsey is as a DISsatisfied customer. It would
not have taken much (less than a $5 increase in the cost of the kit) to
make it a _LOT_ better, IMNSHO.

It's this kind of stuff that gives kit building a bad name.

73,
Clark

How are you doing it for the Newton? I'd be very interested in that.
I know I could hook it up to one of my TNCs, but they're all much bigger
than the Newton. The Baycom is nice and small, but the software that
comes with it only runs on PCs. Is there enough info around so one could
write a driver for it for a different machine? Is there some other tiny
TNC around now?

Hello!

Greetings for everybody who lives in this big and various World.
Greetings for all who likes music or radio.
I am writing my message from Odessa.
It's interesting town, intercity near Black Sea
and here i'm making the tiny musical radiostation.
Even a small station begin to live when she has a pulsing heart.
Yeah, it's a transmitter.
Step by step i save up means for the transmitter.
Anyway i need your help.
You can write me a letter:

Valery V. Filin
Visotckogo str. 12, fl.24
Odessa, 270025
Ukraine

I'll glad to read your advices, opinions and simply good words.
Peoples who want help me are interesting for myself.
Maybe you have a records which must be on a radio.
Please, send your ideas.
And at last you can support me by small sum:

Commerzbank AG, Frankfurt/Main acc.no.4008869901USD
in favour of Imexbank, Odessa in favour of
Valery Victorovich Filin acc.no.001139619.44

Or the way trough the american bank:

The Bank Of New York, N.Y. acc.no.890-0054-808 in favour of
Dialogbank in favour of Imexbank acc.no.02000090088 in favour of
Valery Victorovich Filin acc.no.001139619.44

Thank you.
Warmest regards,
Valery

Almost all older AM broadcast transmitters used 208volt 3 phase
power. Which is not usually availble at your home.

A popular 1 kilowatt output design used by several manufacturers
was to have a pair of 833A's sometimes modulated by another pair of
833A's.

Now the bad part, all of these old transmitters had PCB
capacitors in them. Most of the older transmitters have been
disassembled and the capacitors shipped to a disposal site. If one
of these caps were to leak or explode it would be a major hazardess
waste cleanup. The PCB liability was the primary reason these
transmitters were scraped.

There are several ways this could be done. Look at the article on SSB
outphasers is the current issue (in Australia I think this is April)
of Electronics and Wireless World . You could use allpass networks
with Opamps or a "brute force" solution is the poly phase network
(see http://www.iinet.net.au/~richardh)

The Johnson ring counter using two flip flops is accurate to about
10-15 MHz (input 40-60 MHz). If you want linear phase shift then you
will have to use a passive network. The Polyphase network is a "brute
-force" solution using quite a lot of components but gives a braodband
quadrature phase shift with some loss.
I am currently working on a quadrature oscillator using a dual DDS
chip (Q2334) from Qualcomm. I have managed to get a single quadrature
frequency from the board but have still write the software to decode a
keypad etc. The spurious outputs are a problem with the DDS approach.
Using an 8 bit DAC the spurs appear to be about 45dB down which is
about predicted.

I had someone build an FM car radio diversity antenna for me which is not working right. FYI, the theory of this antenna is that two antennas are monitored for the strongest pilot subcarrier signal and the circuit constantly switches to the one receiving the best signal to minimize multipath distortion. If there's someone in the Chicago area who would be interested in troubleshooting this for me I'd be really grateful to hear from you! I do have a .gif file of the schematic to send if you'd like to look it over.

I will probably get flamed for this (probably with your paint stripper) but this is apples and oranges. A vacuum rework station is not the tool for mass desoldering. Similarly, a hot air gun or paint stripper is not the tool to be used where all you want to do is remove one part without affecting the rest of the board. You risk damaging other components in ways that may not show up immediately. There are hot air temperature controlled rework stations for pulling large multilegged chips but at least there is more control over area of heating and temperature.

OK, I have my asbestos suit on now. :-)

Source record: 104409

I still have one of the company's HP network analysers on loan at home. These are *REALLY* nice toys (oops -- tools). They allow you to plot magnitude and phase vs frequency from 100 Hz to 40MHz for any 2 terminal device (there are other functions as well).

The thing that this particular model does *great* is to calculate an equivalent circuit for the 2 terminal device you hook up to it.

I am pulling a bunch of coils from old circuit boards to use in a couple of projects, so I did an equivalent circuit for them.

In the process I found some old toroids I had wound many years ago. I *QUICKLY* discovered which toroids were ferrite and which were powdered iron. In every case the ferrite cores (usually 67 mix) showed *very* high inductance below 1 MHz, *but* they showed self-resonance in the low MHz range and turned into good capacitors as the frequency went into the HF range. They make really good inductors for filters and transformers in switching power supplies, but they are useless for inductors at HF.

The point to this is that it is *very* important to measure the inductance of any unknown core at the frequency where you will use it. You need to not only measure the inductance, but the Q as well. Ferrites (and powdered iron outside the useful range) may be inductive, but the Q may be awful! You need fairly good test equipment to do this.

Now for my soapbox:

Any toroid should work OK below 1MHz regardless of core type. There will be varying capabilities depending on core type, but they should do OK.

When you start to do HF and VHF work, spend the money to buy brand new cores! That way you know exactly what you have. The new cores are cheap enough, and you will probably need $10 or so worth of cores for any project, so you don't have to worry about a minimum order from somewhere. I purchased 4 Yellow Amidon Iron core toroids (low VHF region) for about $2.50 a couple of years ago at the local electronics store. It's cheap insurance for knowing that I have the best core for the job.

While on the subject of color coding: If you didn't buy the core new and make sure you labled it, you probably don't know what it is. There are some imported cores I have found that use the same colors as the Amidon cores, but they *are not* the same material. Most of the stuff I scrounged from consumer equipment is ferrite even though the

colors would indicate iron core.

Perhaps, but there a great many NRA "moderates" who State and Federal legislators had better pay attention to when it comes to messing with fundamental rights.

We don't need more knee-jerk laws enacted. We need to enforce the laws we already have!

I'm looking for 6 or more ceramic piston caps of no more than 10 pf
for a pre-amp I'm working on.

Something like a Johanson lug or turret type would be fine, and I don't
mind used or surplus; it's just that Newark has a large minimum order
and Active doesn't carry the piston type.

leave me mail at va3rr@amsat.org

Here are few 12 bit parts you might find interesting:

Manufacturer Model Rate (MHz)
Analog Devices AD9713B 80
Burr-Brown DAC602 100
Harris Semi HI5731 100
SPT SPT9713 100

I think you'll find in general that using a DAC rated at 100
MSPS will give you superior spectral performance than those
that just meet your rate at 50 MSPS.

Also, Analog Devices just introduced a new line of low
glitch energy 100 MSPS DACs in their AD976X family.

Analog Devices also has a DDS chip with built-in low-glitch
10 bit DAC that clocks at 125 MSPS. Part number is AD9850.

Whoa! Surely you aren't talking about Fair-Rite #67? That's
a material with a mu of 40 and rather low saturation flux density.
Totally useless for switching power supplies. However, it is one of
the best core materials for HF. Here are some measured Q numbers for
15 turns of #22 wire on a 1/2 inch O.D. Fair-rite 67 core:

Frequency: Q:

3.4 MHz 450
4.75 480
6.8 450
10.5 360
17 180
22.9 107
30.8 85

At the low end of this range, I don't think anything can beat it.
At the high end, Fair-rite 68 starts to compete with it.

A dish is a dish is a dish.

Depends on what you feed it with. There are formulas to calculate gain
vs. frequency of parabolic reflectors. They'd work GREAT at 10.5 GHz,
but you could just as well use them all the way down to audio frequencies.
Put your ear in the focal point and you'll be amazed at what you can
hear at great distances.

-hello
well #12 usually does mean 12 gauge as in wire gauge and not
shot gun it is from memmory about 1/8 of an inch thick and a wet
finger in the air tells me the arrl is not far away
you need strong thumbs to wind #12 into 1/2 inch coils
the gauge isn't critical it's the turns that count and at this freq
the length of the legs just because it isn't coiled don't stop it
being an inductor! if it's critical read up on strip lines etched
onto pcb they are much better at vhf and matching to rf devices is simplified
have fun-

-hello
if you only want relative readings and cheap construction
then carefully tuck a couple of good quality diodes under the
outer copper braid of some good coax earthing the one end of course
by slitting the pvc or pet outer and soldering carefully bring the
other end of each diode out insulated and with a very small resistor in
series say .1 watt 470 ohms decouple it with a disc ceramic cap back to the
outer braid
use the coax in line with tx output and switch the meter between diodes
the 470 ohms prevents inrush to the cap blowing the diode if used on very
high power tx's
you can't seriously measure watts with a diode """""-

Hello All,

I have the following list of hardline connectors for sale
All connectors are used but in good condition.

(1) of HCC-78-50NM for 7/8" air

(2) of HCC-78-50NF for 7/8" air

(2) of FLC-78- 50NF for7/8" foam

(3) of FLC-12-50NM for 1/2" foam

All 7/8" connectors are $20.00 and the 1/2" are $10.00

There is in the ARRL BBS a program to calculate coils coil112.exe
(http://oak.oakland.edu:8080/pub/hamradio/arrl/bbs/programs)

if that can help you.

I will not however wind coils on a form for 10Ghz. In that
range I will use microstrips made on copper clad. They are
a lot more precise and stable.

To calculate microstrips and things like that there is a super
nice program on the WEB for FREE at:

http://users.deltanet.com/~pekarek/txline.html

If you are stuck and don't have any measuring instruments
but still have a full coverage receiver you can always
put a capacitor in // with a coil and put it in serie
with your antenna. That // circuit will be very high
impedance at resonance and you will observe a dip
on the S-meter and silencing of the receiver.

Knowing F and C you can calculate L. With nanohenries however it is another story. Connexions alone will make measurements impossible to make with any accuracy.

Source record: 104331

Check your math, guys -- those coils sound awfully big for use
on 10 GHz, unless they're for power supply and bias filtering.

You can pick up scrap 12 ga wire on any job site -- it's
what they wire new homes with. And the gauge of the wire
in inductors is relatively non-critical -- it's more an issue
of how tight the turns need to be (TPI) to get the desired
inductance. Get out your spreadsheet and step through
the values on the ARRL inductance equation (which, incidentally,
is an APPROXIMATION) to see how little the inductance varies
with wire diameter.

A significant factor of wire size vs. turns per inch is -- you
can easily make a bifilar wind on a removable core, remove
one winding, and remove the core to have a perfect air-core coil.
The extra winding works as a spacer.

For 1/2" diameter, a drill bit held in a vise will work perfectly.

You could use a RF radiation field servey meter that would give you mw/cmsq
The probes used for such meters are so broad banded that you would
have a difficult time determining which frequencies you are measuring.

The only way to get a good feel for the spectrum is with a spectrum analyzer.
You can connect an amplifier to your Yagi if the signals are low level.
You could build a spectrum analizer that would connect up to an o-scope but I
have never seen one that would extend above 1.2 without down conversion.

You would be much better off with a portable spectrum analyzer tektronics makes
a model 492P which retailed for ~ $12K US. Try a rental place or maybe Tucker
will rent/lease one for your measurements. They are on the WWW I don't have
the address handy. Use a search engine.

You would then need to calculate the free space attenuation of the signal level
you recieved and you could determine the approx tx output if you know the
distance from the emitter.

I don't know of a transformer that will produce three phase, but I have taken capacitors and shifted one side of the single phase 240 vac to get a new phase which worked with a welder. There is a rotory converter which is a three phase motor with some capacitors that does produce a better 3 phase.

The MAR-6's are used as IF amps and will work fine. You can buy them direct
from Mini Circuits (in quantity) or from Down East Microwave 908-996-3584.

Are there any vendors of IEEE488 pcb modules or chips that can be used to give a piece of equipment GPIB talk/listen capability? The equipment has to be standalone (not tied to a PC or controller box) so a PC plug-in card w/ control wires to the instrument won't do.

Thanks in advance for any info.

Alternatively you could digitize it, feed it into a DSP, and do
it in software.

Q: How many hardware engineers does it take to change a lightbulb?

A: None! You can fix anything in software.

Another alternative is to get the COMTELCO A1801HB-50 SHUNT FED 6 Meter antenna. This antenna is being used heavily on the west coast. Only the shunt fed version is resonant on both 6 and 2M and works very well on both bands. The antenna is under $35.00 It is a unity gain antenna. It comes with a Motorola NMO mount in the base. It uses a plunger center contact instead of a leaf spring. The antenna model above is all black in color.

Analog Devices has some pretty good DAC choices. Ive used the
AD9721 (US$27) hooked up to a STEL1178 at a clock freq. of 64MHz to
achieve spurs at about -53 dBc. over a freq. range of 12-28 MHz. They
have also come out with a full blown NCO/DAC solution in a single package
(AD9901 or AD7001) for about US$17. Good Luck.

The attraction for me was the price, the general idiot-proofness of the support electronics, and the price. This was an opportunity for me to do something genuinely different (for me, anyway) at minimal risk. To adapt a piece of equipment to another purpose, in the best ham tradition. Maybe even to inspire a few folks to get out of their 2m FM rut.

I've since seen an article in VHF Communications on injection locking a Gunn source to a handheld and a step-recovery diode (maybe a green LED?) for NBFM. Hmmm...the somewhat limited nature of WBFM isn't really an issue here - the only non-LOS path from CN89 is EME, which is a pretty big step up from a few milliwatts of FM or SSB.

Thanks to folks for their words of encouragement...QRZ 10 GHz?

> If anyone's interested, reply to the and I'll send the file.

> improvement.

There isn't much to mine; it's straight out of Mini-Circuits app notes. I used MMICs I had available and made the pc board the size of a credit card, which seemed about right for what needed to go on it. The modulators are on perfboard, also the size of a credit card.

A friend of mine bought a Korean War vintage Sniperscope (P.O.#27-43200-03, dated 6/23/51) at a garage sale. It is missing the power pack which supplies 20kV for the image tube and some lower control voltages. It uses the newer image tube, the number of which I have forgotten.

I am trying to help him find (1) a manual, schematic, or any other information on this piece of equipment, and (2) a power pack, or plans for one, or at least specifications so we can design one ourselves. Any assistance will be greatly appreciated.

I will try to monitor these groups, but if you can copy me by email also it will help. Thanks very much.

> >this package that would care to comment on their experience with it?

I have used EWB. My experience is that I spend more time on getting it
work than I would building the circuits.

As an example: I play around with RF oscillators a lot and I find that
it is not very good at simulating those. I can usually build the circuits
in less time then I have to spend in getting EWB "configured" correctly
to get a trace on the 'scope.

In fact quite often I end up proving EWB with my circuits instead of proving
the circuits by EWB.

However, you should check what others have experienced as well. I find it
great for DC/Audion work, I would not recommend it for RF stuff.

Nathan,

100nH = 100 X 10**(-9) H = 0.1 X 10**(-6) H = 0.1 uH (not mH)

Note: 1000 nH = 1 uH and 1000 uH = 1 mH

> I have never wound a
>coil before, but I got out my trusty ARRL Handbook and found an

>turns for the 100nH coils and just shy of 2 turns for the 75nH coil.

Check again, using the conversion factors above. You want 0.1 uH and
0.075 uH, I think. This will save a lot of copper.

> The first question is this: since I don't have any way of
>measuring the inductance of the finished coil to verify these values,
>can someone verify that these are correct?

Ask the author or designer what he used. You may be able to buy these
parts from DigiKey or Moser. Be sure they handle enough current and
don't have self resonances at frequencies that will impair the
operation of the circuit. There just isn,t much coil to get 100 nH.

Or maybe they are just traces on a printed cicuit board.

>The second question is, what

I would say it is 12 AWG wire (American Wire Guage).

> Also,
>does Radio Shaft stock the stuff, or will I have to order it from
>somewhere (as far as electronic components go, there isn't really
>anything BUT RS locally)?

It's often used for house wiring. You can probablly beg some off an
electrician friend or buy some at the lumber yard or hardware store.
You may have to get insulated wire and remove the insulation.

You don't need it for this project.

> I'm kind of at a dead-end until I find out

>Ferrites (and powdered iron outside the useful range) may be
>inductive, but the Q may be awful! You need fairly good test
>equipment to do this.

Hi Ray,

Boy, someone from Atlanta really chewed me out (a long time ago) for suggesting the permeability changed with frequency. The vocal expert insisted the insertion of a steel rod in an RF coil would lower the resonant frequency, when it actually raises it.

Another common misconception is steel near a RF tank is worse than something like brass or lead. At radio frequencies, eddy currents cause magnetic effects to disappear. Any type of solid metal conductor jammed up against the tank coil will RAISE the resonant frequency and lower the coil's Q.

You are exactly correct about toroids, denser materials used in ferrites loose permeability with frequency and the permeability shift can even be in a negative direction. The winding can actually look capacitive!

The ARRL Handbook had a steel wool balun that had this exact effect. The common mode impedance was reduced by the steel wool! Exactly opposite the effect desired and intended.

One company in Texas "Tucks" toroids in a TVI filter. Even though the cores are powdered iron, inductance drops through the floor at VHF. When that effect is combined with long leads on disc type caps (they become inductive at VHF!) the low pass filter passes VHF signals pretty good.

I always wonder how well most TV deflection yoke cores work at HF, since the yoke is designed for audio frequencies.

BTW, Q's can be accurately measured (up to perhaps a hundred) with a signal generator (like the MFJ259 analyzer) two Schottkey diodes, two .001 disc caps, a high impedance DVM, and a small mica cap.

On second thought, a person could use the 259 and mica cap alone.

MAR-6 is rated for 2 GHz tops. At 10 GHz, I don't think you will get
appreciable gain out of it. Or do you mean 1.0 GHz?

Rather well, it seems.

G0SNO (RSGB EMC committee) has measured the performance of 14 turns on a yoke core with 29mm inside diameter. The inductance measured at low frequencies was about 70uH. In a 50ohm system the common-mode attenuation peaked to 34dB at 20MHz, and was >20dB from 2-65MHz.

Out of all the branded ferrite rings and clip-on cores he tested, with the numbers of turns optimized to cover the higher HF bands, none of them was more than 6dB better than the yoke core from 1.8-50MHz.
And the yoke core was the only one big enough to take large power cable or coax.

Different TV designers may have used other grades of ferrite, so YMMV.
The nice thing about yoke cores from scrap TVs is that it costs you nothing to find out.

The data are in the latest RSGB Callbook & Information Directory. This kind of information ought to be one of the first things scanned into the new RSGB HQ Web pages (but don't hold your breath).

>Chris (cfb@bga.com)
Hi chris,
regarding the key, when the key opens the cathode cicuit, the cathode will float positive above ground, but only to the point of tube cutoff. This would be around 50 volts, and not the B+ voltage you may expect to see. If however the tube would internally short, you may see B+ across the key.

As for the tube socket, find a local t.v. repair shop and cut the socket from a dead chassis that they may give to you. Maybe check out MCM catalog or ask at the tv shop "where would they buy such a socket?"

Now for the transformer. I'm sure I have something that would work. Dimensions may be a problem. I'm thinking the units I have are about 3.5 x 3.5 inches or somewhat bigger. Probably about 3 pounds. You can have the transformer, but you pay freight from central Pa. area.

Hope this helps. KD3SH Don 73's

Well not quite. The accuracy of the surface may not give the gain
you would expect from looking at the size.

The feed has to be designed to match the dish and some dishes are
easier to design for than others.

Otherwise YEP a dish is a dish.

>fast falling edge of the sawtooth? What think ye?

...so the designers use a higher-frequency grade of ferrite than the simple timebase frequency would suggest? I have no idea! Point is, at least some of the yoke cores seem to work well, so any one that you can catch would be worth trying.

The broadband performance seems to depend on using the optimum number of turns: enough to create the common-mode impedance, but not so many that self-capacitance spoils the performance at the HF end of the range. Judging from G0SNO's extensive measurements, "As many turns as opossible" is definitely NOT the right answer.

Presumably Tom's testing method with the coaxial T-piece and a light bulb would be applicable. (I'd try it today, but the whole workbench is covered with another project :-)

If "comparable to" means having the same stability, selectivity, nice case, nice knobs, etc., then I think the answer is NO, you can't do it for substantially less. In fact, unless your a persistent and skilled scrounger, it would probably cost you more than the commercial model.

However, you CAN build a pretty nice receiver for about half the cost of the Drake, but then again so do Sony, Panasonic, Grundig, Sangeaen, ...

One reasonably cheap route I took about ten years ago was to convert an all-tube general-coverage receiver to transistors and ICs (a sacreligious act to some, I suppose). It was fun, easy, educational, and cheap, and it left me with a pretty good quality SWL receiver.

I can't verify the values for those coils, but November
1993 issue of QST, page 83 has a practical table showing the number of
turns for air core coils, wound around common machine scews, required
for various values of low inductances (16-200 nH). You follow
around the grooves between the screw threads while winding the
coils using the specified wire gauge. The standard design
equations in the ARRL Handbook don't work well for small
values of inductance because of the relation of coil diameter
and wire diameter to relative length of the coil. The table
in the QST article provides data based on actual measurements
made by the author rather than the design equations. #20 (20
AWG) Bell wire or #26 wire-wrap wire are used to build the
coils. For coils requiring values of inducatance between
those shown in the table, you can slightly increase of decease
the length of the coil after winding to compensate if
necessary.

I'm not sure what Bell wire is, but I think it is the cotton
covered stuff that is commonly used to wire household
doorbells. I assume that the cotton is removed before winding
the coil. Maybe someone in the group can help me on this.

This is no doubt true of the higher-powered transmitters, but I don't believe it to be true of any of the 1 kilowatt models I'm familiar with. For example, the Collins 20V-2 I recently purchased runs off 220v single phase. The plate transformers normally have primary taps to account for line voltage variations.

> A popular 1 kilowatt output design used by several manufacturers
>was to have a pair of 833A's sometimes modulated by another pair of

True enough. The Collins runs a pair of 4-400s modulated by another pair.

>waste cleanup. The PCB liability was the primary reason these
>transmitters were scraped.

Actually, I question this since it's the *disposal* of PCBs that is the problem. As long as the transmitter is sitting in a barn someplace, there is no problem. I don't know that small AM broadcast stations of the class which would be running 1kw were (or are) terribly concerned about how things are disposed of. I suspect most transmitters are disposed of thusly: If you show up and haul it off, it's yours. Don't forget that the PCB hazard came to light when PCBs were dumped into rivers and entered the food chain. PCBs sitting inside a sealed capacitor are not something to lose any sleep over, unless you plan on eating the capacitor for dinner.

Everyone has an opinion; I'll give mine. Given enough time and persistence you can build a decent receiver but you will never equal the commercial receivers' bells and whistles, conveniences and packaging that you find in say, a portable Sony ICF-2010, or an Icom R-71 or Drake R8A. You could design a single-band analog VFO receiver for AM SWBC use, but to add a synchronous detector for enhanced reception would greatly complicate the design. If you wanted CW/SSB reception, that would add more circuitry. Don't even think about designing a digital PLL for multiband reception unless you're willing to devote lots of time just to that one section of the radio. My advice is to buy a used radio like the Icom R-71 or Drake R8, use it for several months, then if you're still interested in designing your own, go at it. It'll take you at least a year to put together a homebrew radio, and during that time you will have the enjoyment of a commercial rig. Then, if you lose interest, you'll still have a radio to listen to!

>
>-Tom

Taking your initial sentence literally, "ferrite core", you must
differentiate between iron powder cores versus ferrite cores. It's
somewhat easier to determine an iron powder core, as almost all are
color-coded, whereas most ferrite cores are unpainted, natural black. I
recommend getting the free flyer from Amidon, who sells iron powder and
ferrite cores. Their literature has extensive information on the different
types of cores, plus the color coding of the iron powder cores.
(Amidon,Inc. 3122 Alpine Av, Santa Ana, CA 92704, 714-850-4660).
Identifying ferrite cores is difficult. I have spent hours trying to
identify unknown cores purchased from local surplus outlets. Ferrites
don't lend themselves to testing by finding the resonant frequency with a
parallel capacitor since they are very low Q, broadband devices. Ferrite
permeability changes with frequency too; any inductance you measure has to
be related to the specific frequency you measured it at. Identifying iron
powder cores is only a little easier, only if you can correlate the core
color to a known core's color. At least for iron powder you can make a
parallel resonant circuit and determine a rough permeability that way. In
my tests on unknown iron powder cores, I've been able to correlate within
about 35% to a known core's stated characteristics. For ferrite cores, I'm
fortunate to have access at work to a lab inductance meter where you can
set in a specific frequency to test at. I have known cores to compare to.
I wind one turn thru the core and measure its inductance at a specific
frequency, then compare the result to my known cores. Sometimes you can
get a match and identify the ferrite core.
The June 1996 issue of "Electronics Now" magazine has an article for an
L/C meter kit which I purchased. I am very happy with it. It offers the
ability to measure very small values of inductance, which other
hobby-grade meters do not have. A complete kit is $80; an assembled unit
is $100.
Good luck!
Steve

4130. Wanted: Kenwood TM631A remote control info

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-30 00:00:00 UTC
From: rkoblish@aol.com
Message-ID: <4r507b$f4q@newsbf02.news.aol.com>
Source record: 104360

Can anyone tell me the protocol for controlling the TM621/721 remotely via the mic connector? I know KW used to sell a remote ctrl accessory that looked like a cellphone handset. I believe that that device connected to the mic connector and gave you full control over the radio.

No specific application yet, but some ideas:
1. remote base
2. hide the radio in the car and build an ugly-yet-functional remote control so the thieves don't get ideas.
3. computer control, more memories or whatever.

BTW, Kenwood's website was useless on older gear. They do have service bulletins in .jpg format on their ftp server, though.

tnx,
Bob N3HAT

4131. Need help in building a 2 M mobil antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-06-30 00:00:00 UTC

Howdy..

I want to build my own 2 meter antenna for my handheld radio which i will be using in my truck.. I am on a extremly tight budget (i mean i have like 20 bucks i can spend) i have a bunch of connectors and such that i have from a antenna i made that plugs right onto my radio and that works great, but doesnt work great when i am driving. I have a large rectangular magnet (which i can cut to size) for making it magnet mountible. If anyone has an IDEA or drawing or something they can send me that may help, PLEASE e-mail me at KC7QZR@olywa.net and tell me!!

I also have a supply (60 feet or so) of 12 gauge copper house wire (new never used) if that would work for part of the antenna.

Thanx for any help you can give!!

Brad

I am certainly no lawyer -- but, I THINK that the current laws, passed by our wonderful Congress and signed by our wonderful Presidents (Bush/Clinton et. al.) state that if you sell "contaminated" land that the seller is forever liable for the cost of cleanup. Therefore -- your PCB laden transmitter leaks; you sell the land to someone; 20-years from now, 1 part per billion PCB is detected; -- you are liable for $5-million to get the stuff cleaned up.

I think that I am right.

BTW -- there is a similar "problem" with R390 receivers with "radioactive" dials that glow in the dark.

Well, from personal experience with hurricane OPAL here in Crenshaw
County, Alabama the phones will work after loss of power......for a
while. Once the batteries go down, though, it's all over with. For
most of the day after OPAL came through we had great service, matter of
fact we used the phone as the eye passed through our area that night.
Later that afternoon they went out. We were fortunate, we were only
out of phone service for about 5 days. FWIW.

>> Subject: Question about winding inductors>> I am attempting to build a project which calls for two 100nH and one 75nH) air-core inductors. I have never wound a >> coil before, but I got out my trusty ARRL Handbook and found an >> inductance chart which told me that, assuming 8 Turns Per Inch of no.12 >> bare wire with a 1/2" inside diameter with 1/2" leads, I should use 2.5 >> turns for the 100nH coils and just shy of 2 turns for the 75nH coil. >> The first question is this: since I don't have any way of >> measuring the inductance of the finished coil to verify these values, >> can someone verify that these are correct?

If you can obtain a dip oscillator; connect a 200pF or 100 pF 1% or 2% tolerance silver mica capacitor in parrallel with your coil. Couple the dipper coil to the unknown coil- about 2 or 3 inches distance between, and on a common axis. Measure the frequency of the pair by searching for the resonant dip. Note the frequency.

Handy formula; Unknown inductance L uH = 25330 divided by (f sq MHz x C pF)

and

Unknown capacitance C pF = 25330 divided by (f squared MHz x L uH).

Example; You measure the resonant frequency of your unknown coil parallel with 200 pF capacitor to be 35 MHz;

L uH = 25330 divided by (35 x 35 x 200) = 0.103 uH or 103 nH.

>My questions are these:>- Are there any gotchas when using> normal, sturdy xPDT relays for this type of thing at the mentioned> power and frequency? Will the receiver be blown off the table on> transmission (or be deaf when switching back to RX mode)?>- Is it better to leave the RX antenna center conducter floating when> in TX mode, or should it be shorted to the chassis? Which will> result in less TX energy leaking into the receiver antenna? Chris.

You nearly answered your own question. I doubt that you will "blow the RX off the table"- although the signal will be very strong. Use a second set of contacts on your antenna change-over relay to ground the receiver coax input. In practice- on CW you can simply turn the RX RF gain down on transmitting sessions with your spare hand. The great advantage of the system is that you have virtual "off-air" signal quality monitoring, which normally is not provided with store-bought transceiver operation.

Congratulations on making the effort to build your own.

73, Drew, VK3XU.

I recently aquired some Microwave test equipment, Antique Test Gear, and misc components from a state agency thats downsizing and wonder if anyone might be interested in any of the following....

Local State Agency downsizing and reducing inventory and excess gear, So I find myself the proud new owner of much Microwave gear and no need for it. List as follows....

2 EA - AN/UPM-12A Microwave test sets, Very good physical Condx as they are in transit cases. SWR Indicater / Frequency Meter, etc with Manuals and some accessories.

1 EA - TS-155C/UP Microwave Signal Generator, Great physical condx due to its in a transit case. With manuals and some accessories.

1 EA - Polarad Wide Dispersion Spectrum Analyzer Model #SA-84WA, 10 Mhz - 63.680 Ghz Range, Great physical condition with full documentation and service manual.

1 EA - Narda Model #802 Microwave Frequency Meter in very good shape. No Manuals.

1 EA - Metrodata # TR10 RCVR & # TD13 Telemitry decoder. Tunes 395 - 415 Mhz with 2 VFOs. Each in very good physical condx with manuals.

1 EA - Meuller 8069-B Laboratory grade Temperature Bridge. Antique in beautiful wood cabinet. Magnificent workmanship. In very good physical condx with service/operation manuals and documentation.

1 EA - General Radio Type 554-B Antique Megohm Bridge in wooden cabinet. Good physical condx with documentation.

1 EA - Model "S" Antique DC Microampmeter by Sensitive Research Instrument Corp. Very Good Physical Condx but no manual.

1 EA - MX-1309/urm-23 Microwave Power measuring kit W/Transit case in excellent condition.

1 EA - Bendix Aviation Nose Radar antenna assembly, 22" aluminum dish on very compact AZ/EL drive with feed and waveguide assembly that allows dish to rotate and still work. Very Good Physical condition.

1 EA - 3 Meter Spun Aluminum dish (Solid) with mounting ring on back. In good shape with minor dings.

1 EA - High Power Xtal Controled HF transmitter running 4 conduction cooled 7939's on 13.56 Mhz. As IS for parts.

Many other assorted bit and pieces too numerous to list...

Those interested can contact me at NC7K@VHF.RENO.NV.US for more information.

Tim Marek, NC7K
Reno, NV

Howdy..

I have a few Questions...

I need info on building a Mobil Mag mount antenna for my Truck to use with my HTX-202..

I have been given some advice, but i am looking to build something cheap but looks NORMAL, someone told me to use a coat hanger, etc ..

I have 12 guage wire i can use, but need a little info, what length should i cut it at, to use it at 145.470 (local Repeater) I dont have any kind of swr meter or anything but my radio which will let me know when its pumping out full power...

any help will be most apprecaited (text files. urls. graphics, drawings , etc,, attach then to a e-mail please!!)

ALSO

I am looking for some ham mailing lists.. i am starting one for my areas repeater.. (for the members who have e-mail accounts..) and would like to join a few and echo some good info etc...

Please let me know how to subscribe to those..

THANX!!!

You can make a whip from just a 19 inch length of wire and a coax
connector, IE take a PL-259, solder the wire to the center pin,
and slip a piece of shrink wrap down over it so it can't touch
the outer wall of the connector (filling the cavity with epoxy
is even better). However, for mobile use you really want something
other than copper wire. It would be deformed with every tree branch
impact. What you want is copper plated music wire, with perhaps
an anti-corrosion nickel overplate. That's what commercial whips
are made of. Fortunately, these are cheap. You can get replacement
whips from many sources, often for only $2-$4. You can similarly
solder these whips into a PL-259 if you sand down to the copper
plate first. Your mount is just a SO-239 fixed to a plate attached
to a magnet.

There are enough variables in antenna mounting to make a ruler
measurement insufficient. You really need to borrow a meter to
trim the antenna on frequency. However, the HT is fairly insensitive
to SWR (since it usually has to work with a rubber duck which may
have a wildly varying SWR depending on how and where you are holding
it). So the antenna will work even if you don't trim it exactly to
frequency.

Did you know that there are Bulletin Board Systems (BBSes) that are oriented toward amateur radio? Well, there are quite a few of them and we are adding new listings all the time.
To find out where they are located, point your web browser to: http://www.vni.net/thedirectory and go to the "search engine." Enter the words "amateur radio" (and in a different search enter "ham"). It will return a list of area codes where the boards are located. Click on the links to go the individual area code listings.
Remember to return about once a month as we regularly find and list new boards devoted to amateur radio. There are also BBSes devoted to a wide variety of other topics that you may find of interest.

Dear friends, i am very interested in buying or building a mobile antenna for hf (20, 40 & 80 metres). please any offers or ideas. could be exchanged for any material or anything of your interest from my country. please also offers on base verticals for hf.
I actually use a windom wire aerial about 41 metres long, please tell ideas for improving the system. the fed point with a 1:6 balum is about 9 meters high and the end points about 3 meters high and i have about 2 or 2,5:1 swr in all bands but work better on the warc bands (�?). It should be working without the need of a tuner ATU, but I use it always.....The long part is pointing East and the short one is pointing West. Some people says that it has some directivity through the long wire, but most says that the directivity is perpendicular to the dipole. Any help on this.

Don't forget that the mix versus frequency differences are really only applicable to tuned circuits where the cores are part of a tank. In broadband applications such as transformers the 43 and 61 materials are capable of operation into the hundreds of MHz, depending on the design.

Dear Gary,

Check out the article on the "Steath" antenna reviewed in this month's
CQ Magazine. I wouldn't say it's indestructable, but it's the best so
far.

4150. Homebrew FSK modem

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-02 00:00:00 UTC
From: Kevin Pounders <pounders@qtm.net>
Message-ID: <31D8D2A8.D6B@qtm.net>
Source record: 104282
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I am trying to build an FSK modem for use on 2M packet, but the plans I have calls for a TI TCM3105 FSK modem chip.

I have contacted all of the component suppliers that I know but am unable to locate this chip (is now obsoulite). The one exception had a minimum order of 20 pieces.

Alternatively, I am able to aquire either a Motorola MC14412 or a MC6860, but cannot find the data sheets for these chips.

If anyone can help me locate any of the above item, I would greatly appreciate it.

73,

For anything but research in amateur radio history the book
is largely useless. Even when the current edition came out
10 years ago, some designs given were obsolete.
It is well written though and I like it, but I can not recomend
it as an introduction.

A few weeks ago, I casually read some posts about making a foxhole radio using a razor blade as a rectifier. Last weekend, I fell into possession of a Gillette double edge blade with a sky blue finish still in the original wax paper. Is this the type I need? If so, can someone give me enough details to make an authentic one? Also, any documentation, anectdotes, or facts that would help to make it an educational display would be appreciated.

Someone was recently looking for a Novar socket for a transmitter project. You can get these for (hold your breath) $3.45 at

RF parts
435 South Pacific ST
San Marcos, CA 92069

There is no minimum but there is a minimum shipping of $2 if you order by check. There is a $25 minimum if you order by phone.

The part number for the Novar socket is SK9.

For the USA reader, it was also still available from the ARRL bookstore, the last time I noticed. The RSGB Microwave Handbooks are also excellent - Vol 3 in particular. It's a bit more up to date, too.

Date: 1 Jul 96 13:47:45 GMT
From: wlfuqu00@service1.UKy.EDU (William L. Fuqua III)
Subject: Data on RG-34 coax?

Anyone have data on RG-34 coax. It is at least twice the diameter of RG-8. I had seen a listing of data for various coax cables some time ago but lost it.

73
Bill wa4lav was ko4ww

RG-34 is 1.6 times the diameter of RG-8 and has the same construction as RG-8. RG-34 has a characteristic impedance of 75 ohms unlike RG-8 which is 50 ohms. RG-34 has slightly less loss than RG-8, 2.1 dB vs 2.7 dB per 100 ft. at 200 MHz. At 3 Ghz, the losses of RG-8 and RG-34 are the same at 16 dB per 100 ft.

The point is that PCBs that are safely sealed inside transformers or capacitors are no hazard whatsoever. What do you think is inside all those pole transformers you see up in the air? The PCB problem is that GE dumped tons of the stuff into the Hudson and Housatonic rivers over a period of years. You are not going to have a PCB problem from a sealed transformer or capacitor, even if one should happen to leak on your garage floor. I have a number of oil-filled capacitors and transformers and, although I may lose sleep over a lot of things, this is not one of them.

The article on this was in Hands on Electronics I think, about 5 years
ago. I will see if I still have it.

The razor blade is the correct one with one minor detail, the blade
needed to be used, with the hot spot being next to the corrosion. Use
a pencil lead for the pickup, an old drawing compass is a good way to
mount the lead.

As for the construction follow any crystal radio direction, make it
work with a germanium diode, then replace the diode with the razor
blade setup.

I just wanted to let you all know about something I found at a local home center that is a remarkably good deal.

It's a drill press stand for Dremel Moto-Tools, but it's not made by Dremel. It's imported from France under the "Hobby Pro" label by The Mibro Group, 72 Benbro Drive, Cheektowaga, NY 14225.

It cost me only $30 and is quite solidly built.

Compared to Dremel's drill press stand, it has two big advantages:

* It fits all or virtually all Dremel and Craftsman (corded, not cordless) Moto-Tools, not just the current model.

* It does not "walk" from side to side as it goes down. On the side of the rack is an adjustable pressure plate that lets you compensate for wear and make sure its downfeed is perfectly straight.

I'm using it with an old Craftsman Moto-Tool (that's Dremel's name for it; what's the generic term?) as a circuit board drill. 30,000 RPM is very nice!

It also includes a router table setup which I haven't used.

I'm not affiliated with the company except as a satisfied customer. Has anybody else seen and tried this item?

I don't believe the TCM3105 is obsolete. Texas Intruments still makes them and they are available through Allied Electronics for about $9.00 each according to their latest catalog #956. The only catch is have a minumum order of $25.00. Phone 1-800-433-5700 or check out thier parts lookup for prices and stock at http://www.allied.avnet.com.

Good luck.

Many of these "Old Transmitters" are still in service today. They operate on AC input volatges of 208 to 250 VAC Single Phase. The transformers are taped to allow adjustment for the correct operating voltages.

>
> A popular 1 kilowatt output design used by several manufacturers
>was to have a pair of 833A's sometimes modulated by another pair of
>833A's.

The best know series of this type of transmitter is the Gates BC1F through the H series. The latter H models featured SolidState audio sections with a Pair of 833's for RF and a Pair fo 833's for Audio Modulation. The G and H were about 6' Tall and 4' square. The F was over 7' Tall and about 5' wide and 4' Deep. The bulk of the transmitters were Air.

> Now the bad part, all of these old transmitters had PCB
>capacitors in them. Most of the older transmitters have been

Stations in any size market have long since replaced the PCB capacitors. The laws are so confusing that the cost of replacing the capacitors far outway the possible liability of a transmitter fire.

> 73 de KJ5WA

Charles,

Yes, you have the right kind of razor blade.

I made many of these razor-blade radios as a young boy, from plans in a Boy's Life magazine. Probably about 1959 or so. They really are amazing. NO EXTERNAL POWER! I haven't actually built one for years, but need try it again also!

Here is the basic plan, as I remember it.

Top view: (Sorry for crude ASCII drawing...)

```
\-|-/ long wire
\|/ antenna
RAZOR BLADE |
+--------------------------+ |
| / | |
| Screw A /-/ | Screw B |
+------|- - - - - -(+) /-/==============(+)-------+
| | ` /-/ | |
| | ` lead / | |
| +------------`-------------+ |
----- | |
/ / / | |
good ground | |
(water pipe) | |
| |
+---------O O-------------+
Headphones
```

1) Carefully buff the double-edge razor blade with a grindstone to remove the coating and make it more sensitive.

2) Mount the razor blade loosely on a board, with a 1/2" screw (Screw A) throught the center hole. Put a couple of washers underneath the blade to lift it off the board and another washer above the blade.

3) Take two pieces of insulated bell wire about 5" long and remove a 1" piece of the insulation in the center of each of them.

4) Wrap the bare section of one of the wires around the razor blade screw between the bottom washers that hold it off the board. These two pigtails will be used for connecting to the headphones and ground.

5) Put a couple of washers on another 1/2" screw, and mount it (loosely) to the board about 1/2" away from the edge of the blade.

6) Wrap the bare middle section of the other 5" wire around screw B. These two pigtails will be connected to the headphones and antenna.

7) Get a 3/4" piece of pencil lead. I recommend carving up a wooden pencil (remember those?) so you can get a good strong piece. Sand one end flat (blunt).

8) Cut a bare piece of bell wire, about 2 inches long. Now wrap one end of the wire around the pencil lead about 5 times. (Now you know why the lead needs to be fairly "fat".) The lead should protrude from the bottom of this little coil of wire.

9) Mount the other end of this wire to screw B.

10) Tighten both screws.

11) Bend the piece of wire holding the pencil lead so that the blunt end of the lead rests on the surface of the razor blade with as much surface contact as possible.

12) Connect one of the wires from screw A to a water pipe and one of the wires from screw B to a long piece of wire for an antenna.

13) Connect the other wire from Screw A to one side of the headphones. Connect the other wire from Screw B to the other side of the headphones. (Sorry, I don't have the specs on the kind of headphones to use; I had a cheap pair and they worked fine.)

14) Listen.

To tune the radio, carefully wiggle the lead (or wire holding the lead) and move it around the surface of the razor blade. Let go when you hear music! You should be able to pick up local AM radio stations.

Have fun! Report back if it works!

- Craig, AA0ZZ

_____________________________________________

1.0 What is BASIC Stamp ?
-------------------------

This is being written for people who have no idea of what a BASIC
Stamp is...

BASIC Stamps are small reprogrammable single board computers (SBC)
that run BASIC programs and are made by Parallax, Inc. in US. At
first glance, they may seem fairly minimal - and in fact, they are.
But with software that fully utilizes all available hardware, the
Stamps give you powerful features - without the cost of hardware.

Their low cost and simplicity make the Stamps perfect for many
prototyping and control applications. It's suitable for electronics
hobbyists as well as electronics professionals in many different
areas.

Typical application areas for BASIC Stamp's are...

- General electronics
- Home automation
- Robotics
- Mini PLC
- Education
- Prototyping
- HAM related applications
- Special effects in films
- Industri control
```

- Geological instruments
- Computer peripherals
- Scale model hobbyists
- Model train hobbyists

As an talent engineer and technical writer expressed it...

- BASIC Stamp is the 555 of the 90's !

1.1 What is L.O.S.A all about ?

I started to compile L.O.S.A because I know there are lots of great ideas and many problems that are solved with the BASIC Stamp and the main purpose of this list is to get an idea of what other people are using their BASIC Stamps for and maybe get some inspiration or hints.

Remember it's up to all of us if this list are going to be any good and I'm looking forward to receive a description of your application.

1.2 How can I contribute to this list ?

If you have done something with the BASIC Stamp (big or small) that you are willing to tell others please use the form given below and write a short description, nothing fancy is needed just a simple explanation. If you have source code to share that's even better but it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in the L.O.S.A form on the Web-page...

http://www.hth.com/losa.htm

liver damage. Because the liver isn't working well the cat feels crappy and wants to eat even less. The treatment for this disease is to run a tube down down the cats nose into his stomach, or a PEG tube through the abomine wall into the stomach and feed the cat a liquid diet this way.

I love my cat, but I can't be there every three hours to feed him through the tube for a month. Something about work and deadlines and such. So I went to a local supplus house and got a tiny motor driven pump, a case, some switches, a micro switch, ect...

The micro switch is mounted such that the switch trips for every rotation of the pump shaft. The stamp turns on the pump for on a single rotation at intervels programable from the controll switches on top. An alarm buzzer and LED flash if the pump fails to run for any reason. The unit is programable for 9 differents deleviery rates.

Now he gets a slow continuious feeding and he seems to tolerate this better than the 100ml feeding every three hours.

==========
Title : Logic Rudder [# 002]
==========
Date : 950812
Author: Christer Johansson
E-mail: cj@hth.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : LRUDDER.ZIP
URL : http://www.hth.com/filelibrary/BS1-IC/

Description :

Many of the new and very realistic flight sims available today needs rudder to let you get full control. This one uses a digital pot from Xicor (X9104) and 10 other components. Connects to a standard IBM-PC game port and power is taken from the port.

It uses two micro switches for controlling the rudders left or right and to indicate when rudders move there is a red LED that lights up when you press the micro switches and to indicate center there is a green LED. If you press the both micro swithes the rudder will automaticly return to center position.

There is a trim pot to set the desired step rate from slow to very fast and the Xicor pot has 99 steps wich gives a fair resolution.

==========
Title : Interfacing MAX186 8 channel 12bit A/D [# 003]
==========
Date : 950925
Author: Helmut Fligge

E-mail: h.fligge@asco.nev.sub.de

Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : N/A

Description :

This Program interfaces the Stamp1 to the MAX186 A/D converter. Via RS232 2400bps the stamp is asked to measure channel numbern. After conversion the result will be returned to the host computer as an ascii string (0 .. 4096). Conversion rate is about 4 measures per second.

==========
Title : Scrolling LED Sign [# 004]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Maybe sometime
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Scrolling LED sign, 35 super-bright LEDs in a 5-by-7 matrix in the prototyping area of a Basic Stamp rev D. A scrolling alphanumeric message moves one pixel at a time, just like real scrolling LED signs, except this one only displays one full letter or portion of two letters at a time as the message moves by.

==========
Title : Tone Decoder [# 005]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Soon
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Listens for telephone touchtones, displays phone numbers on LCD screen and echos them out RS-232 port. Circuitry fits in prototyping area of rev D Basic Stamp:

Microphone preamplifier, touchtone decoder IC.

==========
Title : Pager [# 006]
==========
Date : 950928
Author: Don McKenzie
E-mail: donmck@labyrinth.net.au

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : PAGER.BAS
URL : http://www.labyrinth.net.au/~donmck

Description :

This program for the Basic Stamp is used to monitor 4 hardware signals. If a change takes place, (after testing for a false trigger) then a cheap 2400 baud MODEM is used to dial into a Telecom Alpha-Numeric pager. It leaves a message which consists of a 2 digit I.D. (01 to 99) followed by the 4 signal levels of pins 3 to 0.

Status of the signal levels message: 0=Low, 1=High. EG: "011110" means Unit "01" has pins 3, 2, and 1 high, and pin 0 is low.

A "Ring-In" feature is also included. By ringing the MODEM for a short period, then hanging up, the Stamp will dial your Pager and report the current hardware status of these four signals.

This program uses about half of the available memory, so if the user wishes to add enchancements such as "Multiple Ring-In's" say within a minute, for a command selection, there is plenty of program space left.

==========
Title : HexWalker Mobile Robot [# 007]
==========
Date : 960511
Author: Tom Thornton
E-mail: mandtsys@ix.netcom.com

Stamp model : BASIC Stamp Rev. D or BS1-IC
Code available: YES
Filename : WALK.BAS
URL : N/A

Description :

HexWalker is a hexapod robot that exhibits obstacle avoidance behavior. It is controlled by BASIC Stamp, BS1-IC, or Stamp chipset (PIC16C65 + EEPROM). Driven by three servos it is the simplest machine architecture that can walk forward and backward, and turn left or right. A kit is commercially available contact author for

details.

```
========================================================================
Title : Robo Bug [# 008]
========================================================================
Date : 951003
Author: David Novick
E-mail: dkn@cimar.me.ufl.edu
------------------------------------------------------------------------
Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : http://www.me.ufl.edu/~dkn
------------------------------------------------------------------------
Description :

Using two stamps, a robot with six legs (2 degrees of freedom each)
was able to walk and turn (at this stage, not very gracefully).

========================================================================
Title : EXPBOT Robot controlled by Stamp [# 009]
========================================================================
Date : 951009
Author: Marvin Green
E-mail: marvin@agora.rdrop.com
------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : EXPBOT.BAS
URL : E-mail author and he will send it
------------------------------------------------------------------------
Description :

This program allows a cool robot to move abound a room in search of
light. Like a moth. Simple program changes can dramatically change
the robots behavior.

========================================================================
Title : Andrews Ever Evolving Lego Robot [# 010]
========================================================================
Date : 951119
Author: Andrew H. Hochheimer
E-mail: softarts@ciaccess.com
------------------------------------------------------------------------
Stamp model : BS2-IC
Code available: YES
Filename : N/A
URL : http://www.wincom.net/~softarts
------------------------------------------------------------------------
Description :
```

Currently the robot can only navigate to the brightest light source in a room. It's current operation mode has four major steps: - Scan a 180 Degree Field of "Vision" taking light level readings, and determining the brightest direction of light. - Decide if it needs to turn left, right, or continue moving forward. - Check for collision with an object while moving, if a collision occurs, display the total travel distance on the display - Move forward for 1.5 Seconds and then repeat the process.

Currently I am using Two Futaba FP-S128 Servos (any RC Car Servos would work) one to sweep it's "sensors" form left to right, and one to "stear" the robot.

You can see pictures and more information on my homepage, just follow the lego robot link.

==========
Title : Factory Monitoring System [# 011]
==========
Date : 951120
Author: Paul Willemse
E-mail: pjwill@merlion.singnet.com.sg

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author

Description :

The system presently consists of 4 Basic Stamp units. Each monitors up to 5 inputs. The inputs are 'digital' (switches) and/or analog (temp, airflow, current, etc using commercial sensors). All stamps communicate the results via serial mode to a Macintosh (Yes a Mac!) where the results are graphically displayed and monitored. Alarms are set for certain conditions.

The transmission is simple, one way only. Each stamp sends the info at a 'random' interval not exceeding 2 seconds. The message format is fixed, the Mac will throw away any conflicts in case two or more stamps transmit at the same time. BTW this happens very seldom. The max time any stamp can be 'absent' from the chain before an alarm is raised is six seconds (failure, transmission collisons, etc). This is controlled by the Mac.

The 'system' is presently in beta test, the client wishes to expand up to 20 stamps. At that point we will likely use the BS1-IC or BS2-IC on custom boards located around the facility.

Code is available upon request (e-mail) partial, some is proprietory to my client.

==========
Title : Wave to the Cats/Desk Temperature [# 012]

```
=========================================================================
Date : 951121
Author: Paul Haas
E-mail: paulh@hamjudo.com
-------------------------------------------------------------------------
Stamp model : BS1-IC
Code available: Yes
Filename : See web server
URL : http://hogwild.hamjudo.com/cgi-bin/stamp
-------------------------------------------------------------------------
Description :

The Stamp has a serial connection to web server, a cardboard hand, a
servo motor to move the hand, and a DS1620 thermostat chip to meas-
ure the temperature. The web server can request the current temper-
ature or start the hand waving. See the web page for the source code
for the temp and the web server.

It's mostly useless. The cats ignore the hand. A few people find it
entertaining.

=========================================================================
Title : Gamer's Die Roller [# 013]
=========================================================================
Date : 951122
Author: Larry Tremblay
E-mail: ltremblay@domus.com
-------------------------------------------------------------------------
Stamp model : BS2-IC
Code available: N/A
Filename : N/A
URL : N/A
-------------------------------------------------------------------------
Description :

The Gamer's Die roller is a little thing I am putting together as my
first Stamp Project. The Roller allows cumulative rolls of n dice up
to 256 sides, so long as the sum does not exceed 99,999,999(!)

It uses two 74HC161 4 bit counters cycling at 1MHz to draw random
numbers off of. Input is achieved via a Grayhill model 38 keypad
and a 74C922 keypad decoder. Display is on a Siemens PDSP-2111 8
character smart display (5x7 LED characters) fed by two 74HC164
serial to parallel shift registers cascaded so I can use Shiftout to
feed 16 bits of control + data off of 2 pins.

The code is very simple, the most exotic part being the random numb-
er generation. In a nutshell, it is:

Begin Loop
S = 8 bit number drawn from the counter (random)
if S < (255/N) x N (integer divide, N is number of sides on die)
```

```
exit Loop
End Loop

This gets (pseudo) random numbers whose average is not skewed
downwards by the counter's max of 256 (i.e. a 100 sided die is not
affected by the extra 56 in the count maximum)

Using gamer's dice notation, (5d6 = sum of 5 six sided dice, 3d10 =
sum of 3 ten sided dice), the user can input whatever combination
they wish, including just 'd6' for one six sider. The keypad I have
has removeable keycaps with legends, so I have 0-9 plus 'd' and '='
on them.

As noted earlier, since I am using an 8 bit counter, the maximum die
size is 256, although that could be fixed easily by sampling two,
three or more times for each die.

Anyhow, that's it. When the code is done and debugged, I'll be happy
to e-mail it to any who want it.

=============================================================================
Title : Stamp II Serial I/O [# 014]
=============================================================================
Date : 951128
Author: John Hansknecht
E-mail: Hansknec@cebaf.gov
-----------------------------------------------------------------------------
Stamp model : BS2-IC
Code available: Yes
Filename : HAL01.bs2 and HAL01.bas
URL : ftp.parallaxinc.com
-----------------------------------------------------------------------------
Description :

A bare-bones demonstation of 2 way serial communications between a
PC running Qbasic and 1 or more Stamp II's.

=============================================================================
Title : Voice and CW Fox Hunt Transmitter IDer [# 015]
=============================================================================
Date : 951221
Author: Sam Guccione

E-mail: dbell@cup.portal.com
----------------------------------------------------------------------
Stamp model : Faux Stamp (BASIC Stamp clone)
Code available: Yes
Filename : Upon request
URL : N/A
----------------------------------------------------------------------
Description :
```

A simple control loop monitoring lift Call buttons (with debounce)
and Limit switches, forbidding manual control past limits, and en-
forcing a Stop before reversal of direction. This will be used in
an owner -designed and -built single story platform lift for a home.

```
======================================================================
Title : Paging with the Stamp [# 017]
======================================================================
Date : 960104
Author: Kurt Clement
E-mail: kclement@kraft.com
----------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: Yes
Filename : monitor.bas
URL : N/A
----------------------------------------------------------------------
Description :
```

Use the Stamp to monitor several inputs, two temperature and two
contact closures in this application. When inputs go outside set
limits, dial pager and send coded message. Used to monitor power
failures and temperatures for computer and network equipment since
August 1994, running on 9 V power supply from one of the UPS units.

```
======================================================================
Title : Switching Sytem [# 018]
======================================================================
Date : 960109
Author: Alexander Avendano
E-mail: aavendan@aros.net
----------------------------------------------------------------------
```

Stamp model : BS1-IC Module
Code available: N/A
Filename : N/A
URL : N/A

Description :

I'm almost finishing a Basic Stamp Based Switching System (Small Phone system) which I consider very usefull for small companies that cant'n afford other brands. This is designed with a host computer which will have a vox-mail and all the functions like big ones to choose. I'm using BS1-IC's for the extensions process right now.

As soon I have complete it I will give the code away for small Intelligent Switching phone system up to 2 Lines and 4 Extensions using the L.C.D serial circuitry for information display. I forgot to mention that the computer (Host for many processing functions) will be running under Windows 3.1 and Windows 95, making this way a usefull computer not only for the phone system but for ithers application at the office.

Please be free to send me E-mail, about any suggestion.

==========
Title : Door Entry Card Reader [# 019]
==========
Date : 960110
Author: Ed Buckley/J J Barbarello
E-mail: ed@milinst.demon.co.uk

Stamp model : BS1-IC Module
Code available: YES
Filename : N/A
URL : N/A

Description :

Stamp 1 based version of the Card Reader article by J J Barbello as described in the August 1995 edition of Electronics Now. This version uses the Stamp 1 as a local controller determining the card number and deciding whether or not to allow door opening. Optional serial comms back to a master controller and optional local message readout using an LCD Backpack.

Lots of scope for further enhancement/experimentation. Circuit schematic and listing available.

==========
Title : Telephone Card Reader [# 020]
==========
Date : 960119
Author: Francesco Volpe

E-mail: f.volpe@ee.mu.oz.au

Stamp model : BS2-IC Module
Code available: YES
Filename : TELEMARK.LZH
URL : ftp://ftp.ix.de/pub/elrad/010/

Description :

The BS-II is used to read a German telephone card, which is a smart card. For more details see the German Electronic Magazine ELRAD (http://www.ix.de/el).

The data is transfered via RS232 to any terminal program.

==========
Title : DTMF Decoder [# 021]
==========
Date : 960125
Author: Joe Altieri
E-mail: radioman@banished.com

Stamp model : BS2-IC Module
Code available: YES
Filename : DECODE.BS2
URL : N/A

Description :

A new parallax BASIC Stamp II program for decoding a nine digit DTMF sequence of "Touch Tones" for remote activation/de-activation of any electrical appliance via Ham Radio, radio link, telephones, intercoms, etc.

==========
Title : Ion chamber radiation monitor [# 022]
==========
Date : 960125
Author: Jeffrey L. Rothman
E-mail: rothman@bnlls1.nsls.bnl.gov

Stamp model : BS1-IC Module
Code available: YES
Filename : RADMON12.BAS
URL : N/A

Description :

A Basic Stamp monitors the operation of an ion chamber radiation detector. The ion chamber and related circuitry produce a signal with a frequency proportional to the dose rate. The Stamp measures the frequency and calculates the dose rate and total integrated

dose.

The results are displayed on a log scale panel meter and an LCD respectively. The dose rate is also transmitted over RS-232 to a remote PC.

A Front panel button allows the user to reset the total integrated dose. Another button allows the audio alarm to be muted at low dose rates.

==========
Title : Barn Monitor [# 023]
==========
Date : 960203
Author: Lynn A. Roth
E-mail: lynnr@hesston.edu

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : E-mail author

Description :

The Barn Monitor checks the temperature in 5 rooms of a farrowing house. The temperatures are taken by DS1620 chips.

If the temperature goes outside the limit set by the farmer, the Stamp dials a pager using a 2400 baud MODEM. The same occurs if the power goes out.

==========
Title : Dallas one-wire interface [# 024]
==========
Date : 960212
Author: Daniel G. Clemmensen
E-mail: dgc@shirenet.com

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : http://www.shirenet.com/~dgc

Description :

As part of a furnace controller project, I've interfaced A Stamp II to a string of Dallas 1820 digital thermometers. The interface consists of three cheap IC's and some subroutines. A design note and a demo program are available on the web. I have successfully tested the interface with a string of twelve 1820's.

I have not yet tested it with other one-wire devices, although I will update my web site when I do.

Title : Sculpture control [# 025]
================================================================================
Date : 960323
Author: Pierre Olivier
E-mail: olipie@aei.ca
--------------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: N/A
Filename : N/A
URL : N/A
--------------------------------------------------------------------------------
Description :

I have been working with sculptors for some time doing control cir-
cuits for their works using 555 (limited), industrial controllers
(expensive and hell to program) and lately Basic Stamp.

Our latest piece deals with image deconstruction: it consists of 20
vertical cylinders on which an image is wrapped. Each has a photo
detector to detect "position zero", and a custom basic stamp board
with a MC3479 step motor driver that drives a step motor which turns
one cylinder. Each cylinder can thus have its own routine which pos-
itions it precisely (400 steps/rev motors) where we want it for any
amount of time, at any speed (very interesting sonically at sub-
second stepping speeds!).

The stamp outputs direction, step and enable signals to the motor
driver and a ready signal to a common line. It receives signals from
the aforementionned ready line, and from the optical sensor.

It would have been quite a bit more complicated, bulkyer and
expensive to implement this project without the stamp.

================================================================================
Title : Commercial clothes dryer controler [# 026]
================================================================================
Date : 960401
Author: J Amy
E-mail: Kuznjack@aol.com
--------------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : N/A
--------------------------------------------------------------------------------
Description :

Detects drop of coin and increments time remaining register.
Actuates main and heat relays. Checks temperature, and controles
heat relay Periodically decriments time remaining register. Provides
cool down cycle in last four minits.
```

Replaces original controler which costs several hundred dollars, and
is not reliable.

```

Title : Automotive Lamp Control [# 029]
==========================================================================
Date : 960427
Author: Ron Woodward
E-mail: RWoodward@gnn.com
--------------------------------------------------------------------------
Stamp model : BS2-IC Module
```

Code available: N/A (Will share concepts)
Filename : N/A
URL : N/A

Description :

This system involved connecting two BS2 units to a bank of 28 MOSFET drivers which controled the external lighting in a demonstration vehicle shown at the SAE expo in Detroit MI.

The lighting control had to perform PWM modulation simultaniously on 10 different circuits while controling Turn, Stop, Tail, Backup Hi Beam, Low Beam and fog lamp circuits with a set of preprogrammed timing sequences.

The timing was worked out so that the PWM of the lamps was flicker free throughtout the demonstration sequence.

The BS2 units worked together in a master - slave relationship to maintain proper sequencing of lights on both hands of the vehicle.

==========
Title : Single Switch Scanning Device for Disabled [# 030]
==========
Date : 960508
Author: Chuck Benson
E-mail: Chuck%6567006@mcimail.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author

Description :

This project modifies a Lanier VoiceWriter dictation device so that it can be operated by a person with a severe disability such as quadriplegia.

The interface to the device is via the VoiceWriter's hand controller. The connections to the external switches are removed and replaced with switch closures via reed relays driven directly by the PIC's (BASIC Stamp's) I/O.

The user starts operation of the device by operating a SPST switch (typically with his or her cheek or jaw). The user then hears a series of five (5) tones which come from a piezo-electric speaker driven directly from an I/O pin.

The tones correspond to 'Play', 'Stop', 'Record', 'Rewind','Fast Forward'. When the desired tone is heard, the user activates the switch again and a relay corresponding to that function is closed. This in turn provides the desired function from the dictation

device.

The code is a series of nested loops that provide the tone & the
relay selection. Copies of code are available upon e-mail request.

```
==========================================================================
Title : Bell timer for school bell control [# 031]
==========================================================================
Date : 960511
Author: David Abineri
E-mail: dabineri@tso.cin.ix.net
--------------------------------------------------------------------------
Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : E-mail author
--------------------------------------------------------------------------
Description :
```

This is a sytem which allows flexible control of bell schedules for
schools. One may program up to seven different schedules of 30
different times each. Data entry is with a small keypad. Indicators
show the schedule currently being used and the day of the week.

Users may instantly select which schedule to follow and may even
enter a special schedule in a matter of a minute or so. The system
simply operates a relay that rings all the bells in the building.
Editing schedules is allowed as well as manual operation.

```

Title : Photocell MIDI Controller [# 036]
=========================================================================
Date : 960501
Author: Matt Rogalsky
E-mail: matt@lo-cal.music.wesleyan.edu
-------------------------------------------------------------------------
Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
```

URL : http://lo-cal.music.wesleyan.edu:8000/device.html

Description :

"Light Harp" photocell MIDI instrument: an aluminum triangle with 6 photocells in base and built in light source at apex. BS2-IC reads photocells via multiplexer (NS CD4051BC) into 8-bit A/D (NS ADC0831, a la Parallax application note).

For each photocell, if light falls below a given threshold, a MIDI note-on message is sent out pin 15 of stamp. Photocell then won't reset until threshold is exceeded again.

This simple instrument was built at STEIM in Amsterdam to use with the STEIM SensorLab, then adapted at Western Front, Vancouver, to work with the BS2.

4185. How do directional RF wattmeters work ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-03 00:00:00 UTC
From: skubi@angela.inria.fr
Message-ID: <4rekb7$4e8@news-rocq.inria.fr>
Source record: 104315
Cross-posted to: sci.electronics.basics,sci.electronics.components,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I do not understand the principle of the simple directional RF wattmeter.

I consider the following setup: a line carries RF power in two directions simultaneously (eg. power flows from transmitter to antenna, and, because of impedance mismatch at the antenna, some power is reflected back to the transmitter).

A section of this line is made of strip line. There is a second section of strip line, parallel to the first one (and, thus, inductively coupled with it). The second strip line goes from a loading resistor which suppresses wave reflection to an AC voltmeter.

Both sections of strip lines are much shorter than the wavelength of the measured RF signal (which may be as long as 160 m in some ham applications)

Here comes a picture:

```
Main line ----------------------------------------------------------

Second line ------------------------
| |
--- ---
| | | V | AC voltmeter
Anti-reflection | | ---
resistor | | |
| | |
--- |
|
|
```

According to what I have read this is a directional wattmeter: the reading of the voltmeter depends only on the amount of power going through the main line from left to right; the power which goes from right to left has no effect on the measurement.

Therefore, depending on the direction in which you connect this device, you can measure separately the power sent from transmitter to antenna or the power reflected back. With two devices like this, you can directly read the SWR.

This is magic.

I don't understand why and how it works.

Can somebody explain ?

Thanks in advance,

Marcin.

> ed.welch@cheaha.com

One problem in an emergency is that you may not readily get a dial tone
due to overloaded circuits. If you desparately need to make a call and
don't get a dial tone, don't hang up, it could take an hour or more to
get a tone. The system should eventually get to you but you lose you
place in the queue if you hang up. If you provide emergency services you
might can be put on a priority list from your local telco. These numbers
receive higher supervision priority.

Transmission Lines by Johnson, Walter C. has a good explanation...p.190.

He says that the resistor is some value between the two extremes of infinity and zero and that the probe responds to both voltage and current. He also says that the backward traveling wave has the phase of it's CURRENT reversed and this reversed signal can be used to cancel the one obtained from the backward traveling VOLTAGE.

So he writes: Ecoupler = C1*E + C2*I where E and I are the voltage and current of the main line , and C1 and C2 are constants.

E = (E+) + (E-) and I = (E+)/Zo - (E-)/Zo and then

Ecoupler = C1*[(E+) + (E-)] + C2*[(E+)/Zo - (E-)/Zo]

If you adjust the coupling so that C1 = C2/Zo, the two terms containing (E-) will cancel leaving only

Ecoupler = 2*C1*(E+)

then the coupler responds only to waves traveling in one direction.

I know this will take a little soaking in but it is all you need to reveal the magic.

Chuck, KE9UW

4191. Question: Reusing Cell Phone on Ham Band

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-03 00:00:00 UTC
From: Larry Grove <lgrove@corp.atl.com>
Message-ID: <1996Jul3.224345.4638@atl.com>
Source record: 104321

I was given a working cell phone. It is of the type that is installed in cars, so the RF section is not super-miniaturized.

Is it possible to re-use the cell phone's transceiver on a ham band? Has anyone done such a thing and where could I find more information about doing such a thing? (magazines, www URLs, etc)

Thanks...

Correction on the RSGB's address:

Radio Society of Great Britain
Lambda House
Cranborne Road
Potters Bar, Hertfordshire EN6 3JE
England

phone: +44 1707 659015

The new RSGB publication "Practical Transmitters for Novices" includes
comprehensive chapters on 1296 MHz and 10 GHz. It's up to date, and
cheap to boot.

Yes, I am an RSGB member. So I can't disclaim an interest in people
buying RSGB publications - the stronger the organisation, the better
it can represent the interests of amateurs!

CQ Netters,

While browsing through 73 magazine I spotted an advertisement
for a kit of a 2 meter radio that used a Voltage Diode method
of frequency control. Is anyone familiar with this method of frequency
control? How does one program the radio channels on radios with
this kind of technology?
I tried contacting the distributors of the kit, but because of
the time difference and the distance involved a reply may take some
time...
Please reply via e-mail...

4200. Why difficult to generate high power at UHF?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-04 00:00:00 UTC
From: Bill Meara <w.meara@codetel.net.do>
Message-ID: <4rg6p0$hbd@server2.codetel.net.do>
Source record: 104182

Here's a question that has been bothering me for a long time:

Why is it that it becomes more difficult to generate RF power as we increase frequency? Why do HF transceivers often have more power out on 80 meters than they do on 10? Why is it so difficult to get lots of power out in the VHF and UHF ranges?

I have an Kenwood TW4000 2m AND 70cm FM rig with no cw key socket
The query could apply to many FM rigs however.

Is there any risk of damage to the rig if I key the push-to-talk
pins on the mic input socket ?????? and would the output be OK in
waveshape as a clean CW signal ????

If you have done this please let me know your results

Thanks

Hello All,

I have the following list of hardline connectors for sale
All connectors are used but in good condition.

(1) of HCC-78-50NM for 7/8" air

(2) of HCC-78-50NF for 7/8" air

(2) of FLC-78- 50NF for7/8" foam

(3) of FLC-12-50NM for 1/2" foam

All 7/8" connectors are $20.00 and the 1/2" are $10.00

>">have any kind of swr meter or anything but my radio which will let me
>">know when its pumping out full power...

i guess one would want to get the most from any radio transmitter, but that
phrase about "pumping out full power" is very "CBish" - sounds like maybe
a refugee from the CB bands that hasn't been exposed to the idea that some
people actually have radios used for bidirectional communications instead of just
trying to "cover everyone up".

>"You can make a whip from just a 19 inch length of wire and a coax
>"connector, IE take a PL-259,

good answer -- tell the guy what he needs to know - i think my answer was
a pointer to the arrl handbook...

> Just a second...
>When we took the Ham test didn't we have to show that we could figure
>frequency to wave length?

it's in the study materials, although it's possible to pass the test without
having that exact question either on the test or answering it correctly.

>I don't want to flame anyone but it was a basic fact of radio,, I thought.

it is..

> Dean WB0TKC

but like last night on one of the VHF nets i was on, we had a guy that
was on the air but didn't know what his call was...turned out he'd acquired a
radio from someone else and was told it was a CB radio. we told him what he

really had and what he should do to get legal and then went back to the net.

it sounds like KC7QZR could use an elmer and additional reference materials.

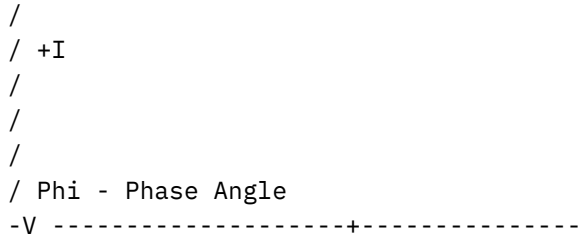
>I know this will take a little soaking in but it is all you need to reveal
>the magic.

Something else that might help is a vector diagram. Let's say we have a voltage vector proportional to the transmission voltage and another voltage vector proportional to the transmission line current. When there are no reflections, these two vectors are adjusted (calibrated) to be equal in magnitude and phase referenced to the Z0 of the line. Then either with reflections (out of phase V and I) or without reflections (in phase V and I) the following holds:

V(i) (vector add) V(v) is proportional to the forward power and

V(i) (vector sub) V(v) is proportional to the reflected power.



Let's say we have 10v proportional to the voltage and 10v proportional to the current and are generating 100w. The following would be true.

For Z0=50 ohms, V(v)=10v is proportional to 71 volts on the line
V(i)=10v is proportional to 1.4 amps on the line

For Z0=75 ohms, V(v)=10v is proportional to 87 volts on the line
V(i)=10v is proportional to 1.15 amps on the line

For Z0=300 ohms, V(v)=10v is proportional to 173 volts on the line
V(i)=10v is proportional to 0.58 amps on the line

For Z0=450 ohms, V(v)=10v is proportional to 212 volts on the line
V(i)=10v is proportional to 0.47 amps on the line

That's why an SWR meter calibrated for 50 ohms needs to be recalibrated to work with 75 ohm line.

>Is it possible to re-use the cell phone's transceiver on a ham band?

Hi Larry, it would be a major project. You would have to change components and readjust the PLL to lock on the 902 MHz band. But the major task would be to replace the internal ROM microcontroller with an identical microcontroller with a different program which, even for me, would be a major development project. You would need complete documentation on the device, something that is hard to come by. It would be much easier to design a 902 MHz HT from scratch, at least for me.

:

Well, I *was* looking into possibly starting a hobby out of HAM.
But judging by these past 2 posts, one by Bill Newkirk WB9IVR, I see that
the attitudes and childishness isn't lmited to the people on "CB" Radios.
Perhaps HAM isn't for me after all, if Bill is any indication of the
types of people that are out there.
Oh, and by the way, Bill - while you were busy slamming this
other guy for his spelling, I noticed YOU need a few grammar lessons as
well, things that were learned in Elementary School.... such as when you
end a sentence while quoting, the period goes inside the quotes, not
outside. Also you seem to have forgotten to end a sentence or two with a
period. Hmm. Seems you aren't the perfect God-almighty after all.
I was told that if a person needed a question answered or some
kind of help, that other HAM operators were happy to help out, and that
the operators of HAM radios were like a family. But what I've just seen
sounds like Channel 19 at a truck stop. No doubt I'll receive a bunch of
childish ranting and raving, cussing, etc in my mail box, so until
then... Ciao!

Actually a 19" piece of coat hanger just looks "black" and doesn't
attract to much attention, except as an antenna.
Twenty years ago, I was having Mosley 5/8 wave 2 meter antennas
stolen off of my car regularly (they looked a lot like CB antennas, and
this was in the middle of the CB craze). So I made a 1/4 wave antenna
from a coat hanger and put it on the car.
A month or so passed. Then, there was a rash of car break-ins,
and *my* car was broken into. My ICOM IC-22A (2 meter rig) was stolen.
And yes... they stole the coat hanger antenna, also.

BTW... after this (and the insurance paid off) I got a new 2 meter
rig and a Hustler colinear antenna. It was never stolen.

Source record: 104195

Hi there
I am trying to build a 10 Ghz EME station and I want to buy a Travelling Wave tube Amplifier, 20 Watts or more. I already own a 3.5 meters dish with control electronics and the rest of the gear. But I could use some more power. If this works, I will be the only 10 GHz EME station currently active in Switzerland.

4214. FS: HP 1740A 100Mhz Oscilloscope

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-04 00:00:00 UTC
From: Dan Ellefson <sl3jj@cc.usu.edu>
Message-ID: <31DC2986.489@cc.usu.edu>
Source record: 104196

FOR SALE: HEWLETT PACKARD 1740A ANALOG 100Mhz OSCILLOSCOPE

The unit is a two channel 100 Mhz oscilloscope with two external triggers.
It comes with two HP X10 probes that came with the scope and two B&K X10/X1 probes
that I bought brand new. All the probes are rated at 100 Mhz. The scope is capable
of deflection factors from 1 mV/div to 20 V/div on the vertical scale and 5 ns/div to
20 s/div on the horizontal scale. The scope also has a delayed sweep feature which is
set by a precision control knob which allows delay settings of 50 ns to 20 s. Other
features of the 1740A include simultanous display of both input channels and the trigger,
bandwidth limit control for attenuation of signals above 20 Mhz, plotting channel A vs B,
choice of 50 Ohm or 1 Megohm input impedance, Chop mode, Alt mode, A+B display, channel
B inversion (this allows A-B display), trigger selction of channel A, B, or external,
trigger level control,LF and HF reject on external trigger inputs, AC, DC, Internal and
External triggering, External /10 triggering, and many more features.
Documentation for the scope is included and consists of the 1740A Operator's Guide
and the 1740A Operating and Service Manual with includes detailed schematics of the scope's
internal circuitry.
The scope comes with a soft leather pouch with a velcro closure that is attached
to the top of the unit allowing storage of manuals and probes. A hard plastic cover is
also included that fits snugly over the front face of the scope to protect the controls
and CRT.
The scope is in very good condition with no noticable dents or scratches. I've had
the scope for quite some time and have been very pleased with its performance and the great
many features that come with it. The reason that I am parting with it is because I recently
purchased a brand new $4500 scope (ouch....) and have no need for two scopes.

PRICE: $495 (buyer pays for shipping)

Description of device deleted...

>
>This is magic.

Aye, magic it is! The equivalent microwave device is even called
a 'magic T'. What you described would commonly be called a
directional coupler, but the idea is the same.

Consider that the parallel lines are also coupled capacitively.
For power flowing in one direction, the capacitive and inductive
coupling add, while for the other direction, they subtract.

The trick is to get the coupling just right, so that the
undesired signal is cancelled exactly. (40dB of suppression is
considered fair, generally.)

I completed your circuit, to complete the directional wattmeter we must add a connection to ground and a capacitance to the center conductor.

Add one of these to each end of the top conductor. Now the top conductor has two voltages imposed on it: one from the inductive coupling due to the current in the main line center conductor and the second from the capacitive coupling due to the voltage on the main line center conductor.

Power flow in different directions results in current in opposite directions, but voltage is just voltage. So for one of these directions the currrent and voltage effects will sum and for the other they will differ. Adjust the capacitance for a good null under the difference condition and you will then have double the output when they sum. Scale the meter to get rid of the 2x difference. Of course this only works for a given I/V ratio, but this is just a transmission line of some chosen, fixed impedance.

Voila', you have a directional wattmeter good for a 50 Ohm line, or whatever line you chose.

A directional coupler has diodes to provide a power indication.

The sampler is used to hook test equipment into circuit ie spectrum analyzer, couter etc.

or couple energy into something else.

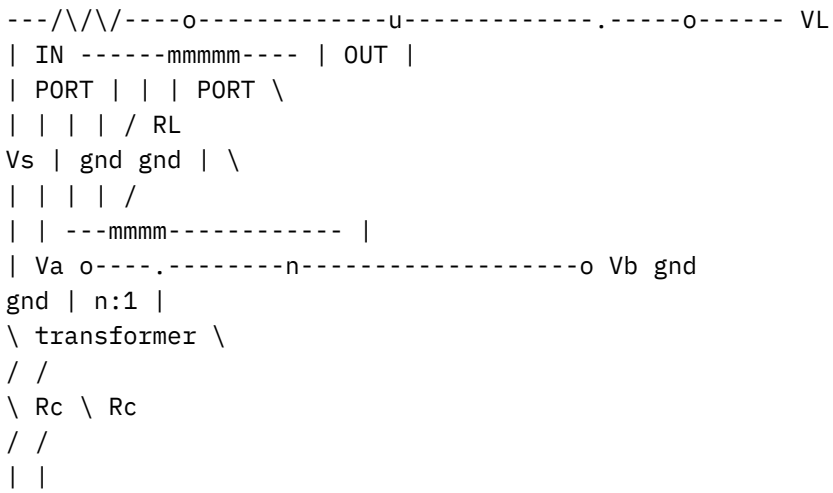
Sometime ago I had the same problem as Marcin - I wanted to understand how an SWR bridge's directional coupler worked, and the only explanations that I could find described its operation in terms of the forward and reflected waves. I had two problems with these explanations:

1. The directional coupler that I wanted to understand was a "lumped-element" not "distributed-element" circuit. That is, essentially it sampled the voltage and currents at one point along the transmission line, and I couldn't understand how one could seperate out the forward and reflected waves by just looking at one point. For me it was equivalent to standing at the seashore and watching the ocean swell - if you just look at one point, you see the water moving up and down as the wave swell passes, but you can't tell the direction of its motion.

2. Also, the directional coupler still operated correctly when a load was connected *directly* to its Antenna port. In this configuration my generator, directional coupler, and load were all attached with very short wires, in essence a "lumped-element" circuit (everything very short compared to the wavelength of the signal). One doesn't usually think of a circuit like this in terms of forward and reflected waves. Instead, you describe it's operation with classical circuit analysis techniques. Realizing this, I sat down to puzzle its operation out, and this is what I came up with:

The direction coupler circuit I analyzed was:



gnd gnd

In this circuit Va and Vb are the two sampling ports, and the value of Rc is set to equal that of the transmission line's characteristic impedance.

From this circuit I derived the following equations (for ease of derivation I assumed a resistive load only):

Vb = (Vs/(2n)((Rc - RL)/(Rs + RL))

Va = (Vs/2n))((Rc + RL)/(Rs + RL))

Note that nothing in these equations mentions forward or reflected waves. However, if you compare them with the standard transmission line equations, their forms are similar.

For example, let's set Va equal to 1 and do some equation substitution. We can derive:

Vb = (Rc - RL)/(Rc + RL)

This looks suspiciously like the equation for the reflection coefficient (well, the negative of it)! We do the equivalent of this derivation when we adjust our SWR meters for full-scale reading in the "forward" direction (that is, set Va = 1), and then read the SWR in the "reflected" position (measure Vb in the above equation).

Marcin drew a different directional coupler circuit in his post - it's a circuit found in many inexpensive SWR meters. I'll contend that one can do a similar analysis on this circuit: after all, if I place it on my work bench in a "lumped-element" circuit configuration, it still functions properly. Therefore one should be able to analyze it's operation with standard circuit analysis techniques in a fashion similar to what I did above. In Marcin's particular circuit, the parallel wires provide both inductive and capacitive coupling, and I would argue that the resistor is not an "anti-reflection" absorbing resistor. Instead, it's function should be explainable in terms of a lumped-element circuit where there are no reflections and where the term "anti-reflection" has no place.

Cheers,

- Jeff, WA6AHL

Not all directional couplers incorporate a means of detecting
power. Many are designed solely for combining or other purposes.

Also, there are a number of means of monitoring power at 1 GHz
and above. Some are directional, others are not, but any one of
them could probably be described as an "RF sampler".

>Perhaps HAM isn't for me after all, if Bill is any indication of the
>types of people that are out there.

you didn't read what i wrote. KC7QZR needs to get in touch with the other locals
and probably review the materials he used to study for the test. if he had the
ARRL materials, i believe (relying on memory here) there's even an example
of what he wanted complete with a list of materials, sources of supply and, yes,
even an explaination of why those values are the ones to use (at least at an
entry level explaination...if he wants the engineering version, he can ask for it.)

> Oh, and by the way, Bill - while you were busy slamming this
>other guy for his spelling, I noticed YOU need a few grammar lessons as
>well, things that were learned in Elementary School.... such as when you
>end a sentence while quoting, the period goes inside the quotes, not
>outside. Also you seem to have forgotten to end a sentence or two with a
>period. Hmm. Seems you aren't the perfect God-almighty after all.

didn't say i was. and welcome to deconstructionist typography. i do have damon
knight's treatment on grammar from GEnie that is a super reference for only a
few typewritten pages - at least it addresses the common errors and mis-
conceptions most people make.

and this is news - not english class. they'd take points off for not capitalizing
the first word of a sentence. can't say there's a hard and fast rule about trailing
punctuation inside of quotes these days. depends on the usage to some extent.
i suppose you think that there should be two spaces after a period. although that's
something you did with typewriters and not when you have proportional fonts
available.

> I was told that if a person needed a question answered or some
>kind of help, that other HAM operators were happy to help out, and that
>the operators of HAM radios were like a family. But what I've just seen
>sounds like Channel 19 at a truck stop. No doubt I'll receive a bunch of
>childish ranting and raving, cussing, etc in my mail box, so until
>then... Ciao!

oh, come now. the guy claims a ham license. therefore, it's expected that he knows something about where the information is located about such things as how to build a simple 1/4-wave whip for 2m. but even if he hadn't known that (as i said, you can pass the test without understanding c=f<lambda>), the fact that the lingo is out of whack indicates that our new KC7 needs further orientation.

remember the object is not to "pump out the most power" but to communicate. and if you actually read up above there, we did tell our bootlegging friend on wednesday that he should consider getting license and he would be welcome, but until then he should just listen and not transmit. in that respect, we were correct in that we advised an illegal station to stop being an illegal station and to get the license and be legal. for that, we run the risk of a citation ourselves (for communicating with an unlicensed station).

i don't think that's a sign of someone not wanting to help. however, things such as some misspellings probably comes from having Dr. Moench at Rose as a mentor ("A -rotor- is the part of a motor that moves. A -rotator- is the device that turns the antenna!").

>This is magic.
>
>I don't understand why and how it works.
>
>Can somebody explain ?

Let me add a very simplicistic picture to the maths presentet so far:

The wave traveling down the main line induces a (weaker) wave
in the coupling line. Both travel the same way, because contributions
coupled into the coupling line at different points and travellint in reverse
direction cancel (destructive interference). So if one end of the coupling
line is terminated properly and the other is fitted with a detector, there you
are.

The lumped element indicator probes the voltage and the current at one
point of the line and compares them. Now the current is in phase for
the foreward going wave and out of phase for the backward moving wave.
(That's what makes the waves move). If you add the detected
current and voltage signals, you see only a signal from the outgoing wave.

Why is the current out of phase for the reflected wave?
because else it would not be moving backwards.

73, Moritz DL5UH

No, my comment on the punctuation was merely to make a point.
You made several snide (sp?) remarks to him, one of which was making him look ignorant because of his spelling. I was simply trying to point out that while his spelling was being insulted by you, your punctuation was bad. No, it's no big deal, but I was trying to say was it didn't make sense to insult him for his writing/spelling style when yours had its faults too. None of us is perfect.
As for the antenna, perhaps he's just a buff who likes to receive only, not transmit, and doesn't have a liscence yet. The handbook does say that's perfectly legal. Maybe he wants to see what's "out there" before getting into the hobby?
I myself am in that position. However, I'm quickly learning that HAM operators aren't the type of people I had heard they are. This fool Myron Calhoun took it on himself to write me an ignorant insulting letter, implying that newcomers are welcome but if they have any questions that they are NOT welcome to ask them and that any information they get is to be obtained solely on their own.
He ALSO commenced to make a weak attempt at hurling insults at me for asking such a "stupid" question about antenna/wave length. What the old fool didn't take time to do is see who asked the question. That was not me, yet he is going to write me and slam me for it.
Myron challenged my "maturity..." I have yet to figure out where he comes off with that. Even if I HAD asked the question about the antenna and wave length, how does that make someone immature?

Look... I was told HAM operators welcome new comers with open arms and are always happy to help someone else get started in the hobby. I was looking in to it on my own and discovered that there are many ways to go (2M, 6M, 10M, etc) and wasn't sure which way to go. I haven't asked though, because anytime someone asks a question like that, he receives nothing but rude replies and remarks. I haven't asked PUBLICLY that is... I've had the fortune of finding ONE friendly ham though.
I was also told to start going into the amateur (look up the definition for amateur by the way) newsgroups and that I could start participating and asking questions there to help learn. Boy, were they wrong. New HAM operators, or prospects, are treated rudely and insulted... not what I would call a warm welcome.
My apologies to everyone here. I was foolish in believing such an ignorant thing... Don't bother replying publicly, nor in e-mail.
When I post this, I am going to unsubscribe from the asshole, er, amateur radio newsgroups - email will be erased without being read if it's from the newsgroups... don't bother. And don't bother ME.

Hi RWC.

I would like to offer an explaination. It seems the internet can bring out the worst in people. Many come here just to flame and attack. I dont know why it is, perhaps its the anonymity of being behind the keyboard, or something else, but I DO know its basically true in most groups...not just ham radio ones.

There are those who do these types of things reguarly, like Burt, Gerry, Drew and others, as nothing more than to cause trouble. While even I have been sucked into petty flame wars, I think its safe to say that most of us do NOT condon, or support the likes of the above mentioned.

What you heard about hams helping others that want to join is true of most of us. All I will ask, is that you dont base your entire opinion about amatuer radio, by what you hear here.

I would also like to offer any insight, help, suggestion, or anything else you may want, regarding amateur radio.

Take care.

> power out in the VHF and UHF ranges?

Radio gear is made to work on higher frequencies by making it
smaller. However, there is no easy way to make the parts more
conductive to keep the losses low. Thus, more exotic
techniques are used to get the unwanted heat out.

Trying to use excessively large parts doesn't work--you
end up with power going around in circles just
generating heat. Too much heat and the circuit fails.

You can switch to different technologies to maintain a
large size as you go to higher frequencies.

> N5TGL

How much power out do you need ? If 80 - 100 watts will do
look up the MRF492 in the Motorola RF transistor databook.
This is an 80 watt transistor. 5 to 10 watts in will give full power
out. Very simple to build. I built a few of these.

As for switching the amp in circuit during TX and bypassing it on RX,
I always prefer to use positive keying to key up the amplifier versus
an rf sensing switch. Most rigs have a set of contacts on a rear panel
connector available for this purpose.

I could mail you shematics of a couple of designs using this part.
E-mail me if you'd like more details.

Regards...
Hugh Duff VA3TO Toronto

The are 2 sent to me by Ed Humphries.

He does ask the following:

Note: I do not claim to have invented this puppy, but
I have an interest in keeping the articles intact as is. They are only
one printed page each, so feel free to distribute; just please do not
delete my name and authorship of the article.

--cut here--

A Copper Tube J-pole
by Ed Humphries - N5RCK
edh@hpuerca.atl.hp.com

The following is a description of a J-Pole antenna made
from copper
pipe. You can use 1/2 inch to 1 inch pipe (wall thickness will
affect stiffness/stability AND price, but not
performance). Larger
diameter pipe increases bandwidth, but 1/2 inch is fine
for amateur
frequencies. Start with a 10 foot (standard) length of pipe, 1 90
degree (right angle) fitting, 1 "tee" fitting, 2 end-caps, 2 hose
clamps (worm-gear adjustable of the appropriate
diameter), and your
coax (end stripped, braid separated, center conducter
stripped, and
coax sealant to close opening in coax to keep water
out). Use a tube
cutter (for best/easiest results) and cut the 10 foot
pipe according
to the dimensions needed following the diagram below:

```
__
| <=endcap
|
|
5/8 | for 146 MHz
|
|
wave |
|
|
|
-- | | <=endcap
| | 1/4
```

```
| | wave
| |
coax ctr conductor=>* *<= coax shield
| |
@ 5"-->| |
tee => --- <= elbow
|
| < "leftover" pipe
|
```

For best general purpose use, the 5/8th wave version should be used. The dimensions to cut are: 66 1/2 inches (5/8 + 1/4 matching section), 19 inches (other half of 1/4 matching section), 3/4 inch (joins the tee and the elbow), and the "leftover" 33 3/4 inchs that forms the base. Use standard plumbing solder methods to join main section to base using the tee. Use the 3/4 inch piece and the elbow to attach the 19 inch piece. Be careful to keep pieces parallel.

This will give you a center frequency of 146 MHz. Attach the coax as shown using the hose clamps. Adjust the swr at 146 MHz by sliding the connections up or down as needed -- you should be able to reach very close to 1:1 (best to do this in approximately where you intend to use the antenna - the base can be attached directly to a mast by two hose clamps). Try not to be standing right by the antenna!

It has been noted that this design can lead to rf coupling onto the feedline. To avoid this, put a ferrite on the coax at the feedpoint, or use 3 turns (@1") of the coax taped together at the feedpoint.

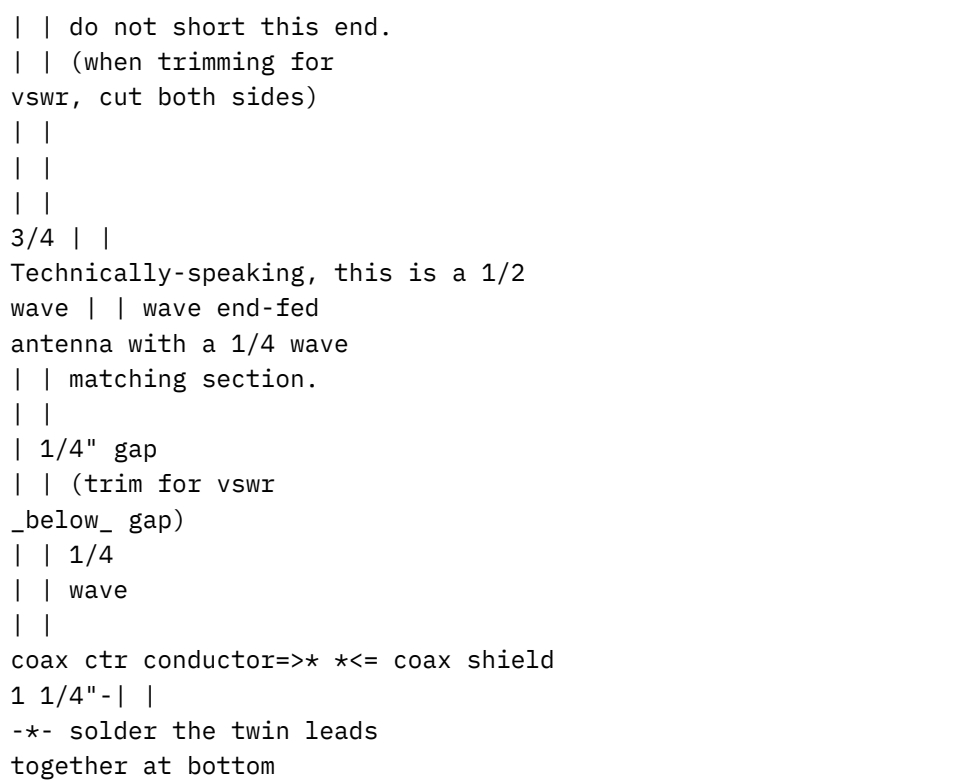
Other center freq dimensions: (adjust 5/8 section accordingly). 144 =19.25 inches, 145 =19.12, 146 =19, 147 =18.86, 148 =18.73.

--cut here--

TV Twin-lead J-pole
By Ed Humphries - N5RCK
edh@hpuerca.atl.hp.com

The following is a description of a J-Pole antenna made from 300 ohm TV twin-lead. They have quite a few advantages which include improved

performance for 2-meter HTs, portability, and low cost.



For a center frequency of 146 MHz:
1. Start with @54" of TV twin lead (flat, NOT foam core)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip
insulation on both
sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from coax shield solder point and cut
out 1/4" notch.
5. Measure 50 1/3" from coax center conductor solder
point and trim
off twin lead at that point.
6. Feed with a length of RG58U coax. Tape coax at
feedpoint to the
twin lead for strength and seal coax for weather protection.

It has been noted that this design can lead to rf
coupling onto the
feedline. To avoid, put ferrite beads on the coax at the
feedpoint,
or use 3-5 turns of coax (1"-2") taped together at the feedpoint.

You may attach an alligator clip to the plastic on the top of
the antenna in order to easily hang it. Alternately, punch a
hole near the top and use a length of fishing line to hang.

This design appears on many BBSs, in club newsletters,
and in books;

the earliest reference that I know of is a Jan. 1984
D.A.R.C. antenna
article by James Burks, KA5QYV.

FYI, the 1/4 wave sections for other center frequencies are:
144 MHz =17 inches, 145 =16.88, 146 =16.75, 147 =16.65,
148 =16.54

I usually just go ahead and solder the coax in place and trim down to as close to 1:1 vswr as I can get. I use the MFJ vhf antenna analyzer and a frequency counter then afterwards test with a radio and in-line swr/power meter. When done, the antenna should also present 1:1.2-3 vswr in the center of 444MHz band as well (demonstrated on my dual-band meter and Alinco DJ-580). You will need to trim in a 3:1 ratio to maintain the 3/4 to 1/4 wave.

Well, I've had a chance to search my library for a good explanation of how Marcin's directional coupler circuit operates. I found a number of descriptions: some poor, some good, but the best explanation I've found is in the book "Single-Sideband Systems and Circuits," by Sabin and Schoenike (1987, McGraw-Hill), which I will try to summarize here.

"The Inductive Loop Directional Coupler"

First, I will attempt to crudely render their excellent drawings in ASCII format:

```
coax center cond.----------------------------------------

------------------------
| (pickup loop) |
/ |
\ R RF
/ Detector
\ |
| |
coax shield---------.------------------------.--------
```

(You may remark that this looks just like part of an inexpensive SWR meter that is readily purchased at most radio stores.)

Now, this physical circuit, for the purposes of analysis, can be modeled with lumped-elements as:

```
coax center cond.--------.-----------------------------------
|
----- C
----- M
| -------------mmmmm-----------
| |
/ |
\ R RF
/ Detector
\ |
| |
coax shield-----------.------------------------------.-----
```

Where, in this circuit:

C = The capacitance between the pickup loop
and the coax center conductor

M = The mutual inductance between the pickup loop
and the center conductor

(Note that for this lumped-element circuit model to hold true, the
dimensions of the coupling loop must be a fraction of a wavelength).

Now, to start the analysis I'm going to define some quantities:

E = the voltage between the coax center conductor
and the coax shield at the point of measurement.
I = the RF current in the transmission line
Vres = the voltage across the resistor R.
Vind = the voltage across the mutual inductance M
Vmeas = the voltage at the RF Detector
Xc = impedance of capacitor C
Xm = impedance of mutual inductance M

From the circuit and the quantities defined above, I know that:

Vres = (R * E)/Xc for R << Xc
(it's a simple voltage divider)

Vind = I * Xm (polarity of Vind depends on
direction of current flow)

Vmeas = Vres + Vind

= R * E / Xc + I * Xm (if current moving left to
right), or,
= R * E / Xc - I * Xm (if current moving right to
left)

Therefore, the voltage at the detector is the sum (or difference,
depending on the direction of the directional coupler with respect to the
load, and hence current flow) of a sample of the voltage across the
transmission line and a sample of the current through the transmission line at
the *point* of measurement.

I want to stress that word "point." The pickup-loop is very short,
just a fraction of a wavelength long. Thus we are making a measurement
of current and voltage at a "point" in a circuit, stuff of classical
"lumped-element" circuit analysis. Perhaps someone has attached a
transmission line connected to the coupler's output, or perhaps simply a
resistor with inch-long leads. I don't know, and the circuit doesn't
care - it's just sampling voltage and current at this one "point." And
somehow we must take this voltage sample and this current sample and
derive measurements of forward and reflected waves.

First though, it's important to note that, in this model, the
resistor is *not* an "absorbtion" resistor - that is, it is *not*
absorbing either an unwanted forward or reflected wave component in
order that the other (not absorbed) component can be measured (as at
least one book-published explanation would have us believe). Instead, it
is part of a voltage divider which samples the voltage across the

transmission line.

The model of an "absorbtion" resistor is, I believe, in this circuit topology the wrong model to use. When I first ran across it some years ago ("HF Antennas for All Locations," by Moxon) it confused the heck out of me, and it wasn't until I sat down and actually analyzed a directional coupler circuit that I found a model which would work in both "lumped-element" and transmission line applications. The "absorbtion" resistor explanation just does not make sense if you consider the loop to be a lumped-element.

I think part of the confusion is due the construction of the pickup loop itself, which is rather long and its function on first blush mysterious. Because of this length and the lone resistor at its end, I believe there is a natural tendency to accept the absorbtion resistor model. After all, it seems to explain that inexplicably long loop! But remember, at the frequencies where one commonly uses these couplers, the pickup loop length is a *very* small fraction of the wavelength; it's so short that it can be modeled as lumped-element(s), which in this case is an inductor (and capacitor). We could just as easily replace this pickup loop with a toroidal coil and a real capacitor, and we would obtain the same results.

But I digress. Back to the analysis!

Let's imagine that our application calls for a transmission line to be connected to the output port. Is there a way that we can chose the values of R, C, and M such that the voltage at the RF detector is related to either the transmission line's forward voltage or it's reflected voltage, depending on the directional coupler's orientation?

Yes there is! But first, let's write a couple of more equations, this time from transmission line theory:

E = Ef + Er, where:
E = the voltage between the coax center conductor
and the coax shield at the point of measurement.
Ef = forward voltage component of E.
Er = reverse voltage component of E.

I = If - Ir (subtract because the reflected current travels
in the opposite direction).
I = the RF current in the transmission line.
If = the foward current component of I.
Ir = the reverse current component of I.

And, because If = Ef / Zo and Ir = Er / Zo by definition (Zo is the characteristic impedance of the transmission line at the point of measurement), by simple substitution we get:

I = Ef / Zo - Er / Zo

Now let's substitute these three equations into the two earlier equations and re-derive the value of Vmeas.

1. Vmeas = (R / Xc) * (Ef + Er) + (Xm / Zo) * (Ef - Er)
(forward direction)

2. Vmeas = (R / Xc) * (Ef + Er) - (Xm / Zo) * (Ef - Er)
(reverse direction)

To make these two equations relate to either the forward voltage or the reverse voltage independent of the other, we are going to define the values of R, C, and M such that the following relationship is true:

R / Xc = Xm / Zo (in other words, R * C = M / Zo)

Let's plug this into the above equations. These equations now reduce to:

1. Vmeas = 2 * R / Xc * Ef (forward direction)

2. Vmeas = 2 * R / Xc * Er (reverse direction)

We now have seperate measurements for both the forward and reverse direction components of a signal on a transmission line! (Note too that the value of these voltages will change with frequency due to Xc).

That's it. Hopefully, I neither made too many mistakes in my derivations above nor confused the reader too much. Directional couplers are an interesting topic, and if you understand the theory behind the one I've just described, analyzing other directional coupler topologies will be amazingly straightforward (hint: usually they replace the pickup loop with a real toroidal coil and capacitor, or a similar voltage and current sampling topology).

Cheers,

- Jeff, WA6AHL

One of the main reasons is that even a small capacitance looks like a
short circuit at uhf. If we try to use this capacitance as resonant
tuning it can help, but only to a small extent. The next reason is
electron transit time in the amplifier element (tube-transistor), it
becomes difficult to control electron flow so we then resort to
something like a klystron. How much power do you want? Even old
technology can make megawatts in the gigahertz range!

Source record: 104225

Inherited a homebrew Class B amp from one of our original US hams - 1ABY, later designated W1ABY, who became a silent key maybe 15 years or so.

The rig is in tough shape - definitely needs rewiring, retubing and new knobs. All of the coils are in good shape as are the other basic components. Rig weighs about 100 lbs and is in a rack 5 feet high. I have little (read that zero) interest in AM so I'd like to unload this small piece of history. In working shape the rig output much better than 2000 watts....

Anyone interested please e-mail or call (508) 867-6433 and leave a message on my office answering machine. Naturally, your picking up the rig in Central Massachusetts will be condition of sale or trade.

Regarding the latter, I'll take $7,500,000 cash or trade for antennas, QRP rig, keyer or other junk in the $50 to $100 range. Don't think the rig is really worth $7.5 Million, but for the right buyer....

Message-ID: <31DF7381.6B63@dove.mtx.net.au>
Source record: 104229

Hi there I hold an Amateur radio licence (vk5zcf - for the last 25 years), and also a low power regional broadcasting licence (this is mainly to provide "tourist type" information around my local area.

My licence permits "flea power" operation in the FM B'cast band, I am at present using a "modified" ex commercial two-way unit (PLL locked to xtal at frequency / 8 10.?? = 87.60

This tranmitter although in service for nearly 2 years is now in need of retirement (heck I will put it down on 6 metres when it goes out of "active service".

But I need to replace it FAST !!!!!!

I am looking for circuits and knowledge covering the following areas ...

Free-running oscillator circuits that are stable ! - does such a beast exist when running at 88 Mhz ??

or ... Xtal locked circuits that can allow a rock (10.?? Mhz) to be pulled far enough to permit standard deviation output at the final freq (87.6) this is about 18Khz at the rocks natural resonance.

Who can offer me some ideas, alternatively an EASY to get going PLL design that has sufficient loop Time Constant factors to allow the deviation that I need ?
(most PLL's will go GaGa when you try to drag them away from lock by this much deviation swing).

So you can see that I have a genuine dilemma here, if I can find suitably STABLE free-running designs then I am not adverse to using them either.

What can YOU offer to solve this problem ?

I really do look forward to hearing from YOU.

Best regards es 73

Glenville T. Sawyer

Wonder if any of you have conducted experiments, or
have come across papers on the interaction of EM waves
at and near 1.2, 2.4, or 5.7 GHz, with materials?

I am particularly interested in the following materials:
plywood, wafer board and particle board of various
thicknesses, and; asphalt shingles. I am interested
in these materials with varying moisture content,
and if anyone has studied particular adhesives used
in these products.

I am interested in the effects of these materials when
located within the radiating near field of an array.

Any pointers would be appreciated.

Mike

Hello Michael:

How about a linear amplifier that uses a 4CX250R or a couple of them for a six meter amplifier. Get a hold of Varian, Eimac Division 301 Industrial Way San Carlos CA 94070, or phone Linda DeLoring at 800-414-8823 #1 for product information. She can send you technical data on their tubes. Ask for "The Care and Feeding of Power Grid Tubes" book. Also see the ARRL Handbook on the construction of VHF linear amplifiers. Another good source of bouncing off your ideas is RF Parts Co. 435 South Pacific St San Marcos CA 92069 or phone 619-744-0750 for technical help, and 800-737-2728 order line, ask for their free catalog.

Ive seen 6 meter amps at the TRW swap meet in So CA, their fare and few between, but you find them now and again.

Good luck.

Jay.

Various materials have been tested by putting them
in a microwave oven, e.g. PVC. You can be sure that the
material you mention are very lossy when wet.

>I am interested in the effects of these materials when
>located within the radiating near field of an array.

Why? you should not have any materials in the near field,
i.e. a few wavelength around your antenna. This is however
not too difficult at SHF.

>technology can make megawatts in the gigahertz range!
>

-hello
i have read the one reply to this question and see that he left out
the inductance of everything and in my expierience of home brew in uhf
this was the key overiding factor the valves have very long leads in
comparison to transistors so that you cannot get the rf out of the device
used and the second factor which is influenced by the foregoing is the
characteristic frequency roll off in the amplification factor most hf rigs
use either modified audio valves or tv scan valves and so as frequency
increases gain does the inverse, a true rf valve has almost no leads
or co-axial type connector assemblies have look at 4cx250 construction
or 2c39 the electrodes come right through the glass
if you want to make lots of power at uhf then the whole assembly tecniques
have to be co-axial which must be carefully matched to the device, standing
waves are fatal in amplifier construction and they occur in input as well
as output sections-

-hello
you are not as it were at the sea shore but at a point some distance off
toward the land the sea is giving up it's energy to a rock , the rock can't
absorb all the energy as it's consistency is miss matched so it reflects
energy back into the sea and there is a back flow of current which causes
a flow against the tide, waves are produced (and make life uncumfortable for
small boats parked at such an observation point)
your observation will note the massive inflow and the reflected wave at
anti-nodal points, there will be a big positive wave with a small negative
wave supperimposed by attenuating the positive displacement produced the
reflected wave can be measured as a ratio of the larger (hopefully if it is a
near match situation)

It is one of the questions in the pool, but it isn't necessarily on
every test. However, it is naive to use that formula for a real antenna.
You almost always have to adjust the length in order to account for other
variables. The formula gives a *free space* value, but our antennas are
rarely mounted in free space. There are also mechanical factors to consider.

It is not unreasonable for a new amateur to ask this sort of question.
Often those things which appear simplest to those of us with practical
experience can be the most baffling to those with none. Remember, the
only stupid question is the one you neglected to ask.

>Brian Olliver

Brian,

Thanks for the analogy, I like it better than mine - a beach is a lousy place to view wave reflections. A rocky cove is much better.

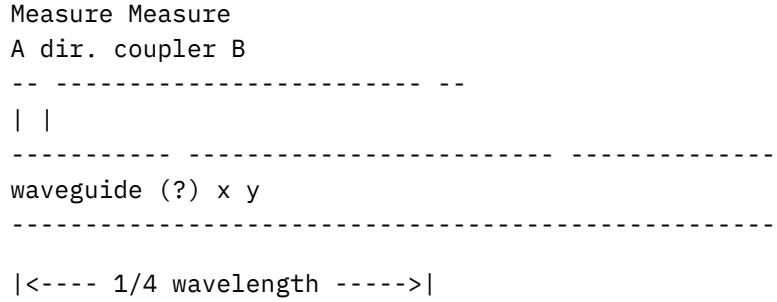
My argument is, if you look at just one point in the water, you won't see two different waves passing in two directions (the forward and reflected waves). Instead, you'd see the water moving up and down as the waves passed, with the height of this movement determined by the constructive/destructive interference of the two waves passing each other. But you could not seperate out the two waves as being two distinct, seperate entities - all you see is the resulting sum of their interaction.

I chose to observe a "point" in the water to illustrate the operation of a lumped-element directional coupler. It "observes" the current and voltage at one point of a transmission line. These two quantities are then used to calculate forward and reverse voltages (a good explanation of how this works appears in an old article by Bruene in the April, '59

issue of QST).

Of course, there's no reason to measure at just one point. Way way back during my University days I was taught that you find SWR by measuring the voltage along a transmission line: find the max, move 1/4 wavelength and find the min, and calculate SWR. I remember being puzzled because I knew that my SWR meter in my shack was not 1/4 wavelength long, and wondering how the heck it did this! It wasn't until recently that I finally understood it (at least, I think I do).

And to digress slightly, I once ran across an example of a directional coupler that truly did find forward and reflected parameters by using constructive/destructive wave interference. If I recall correctly, it was 1/4 wavelength long and looked something like this:



(I think this was done with a waveguide, but I can't remember.)

It worked as follows:

A wave traveling from left to right enters the coupler's port x and travels towards port y. Meanwhile, it is still traveling down the waveguide towards port y. When the waveguide's wave reaches y, it enters this port and, because both it and the wave within the directional coupler are in phase, they add and appear at port B.

However, the wave that entered port y also travels back down the directional coupler towards x. When it reaches x, it has traveled 1/2 wavelength (1/4 from x to y, and 1/4 back again), and so is 180 degrees out of phase with the wave coming in through port x. These two waves cancel, and nothing appears at A.

For a wave traveling in the opposite direction, the reverse happens, and it appears at port A, but not B.

Pretty cool, but frequency dependent.

(Anyone, please correct me if I'm wrong).

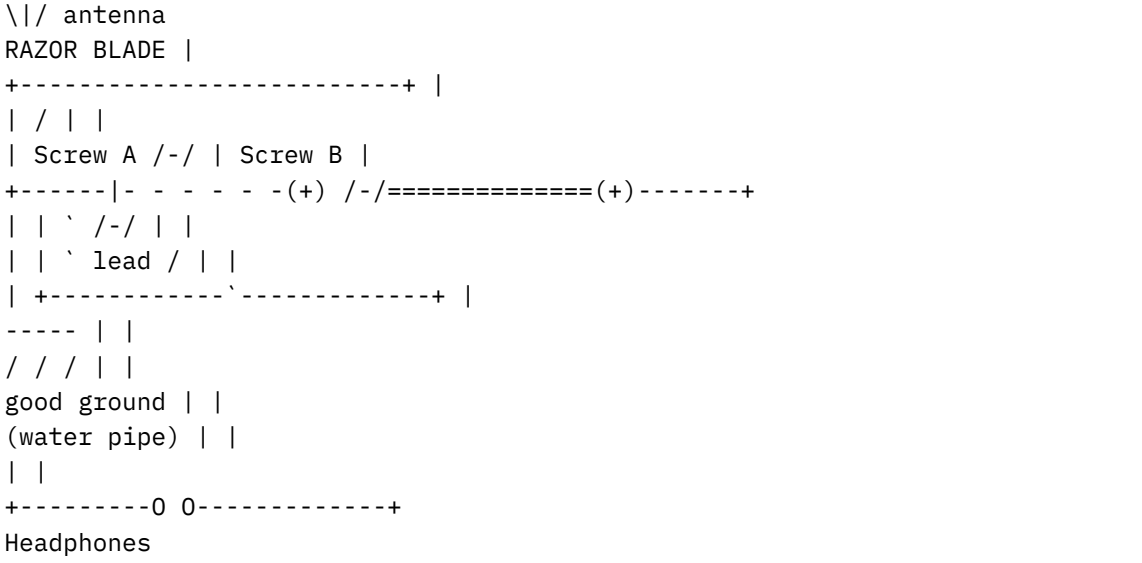
I made many of these razor-blade radios as a young boy, from plans in a
Boy's Life magazine. Probably about 1959 or so. They really are amazing.
NO EXTERNAL POWER! I haven't actually built one for years, but need try it
again also!

Here is the basic plan, as I remember it.

Top view: (Sorry for crude ASCII drawing...)



1) Carefully buff the double-edge razor blade with a grindstone to remove
the coating and make it more sensitive.

2) Mount the razor blade loosely on a board, with a 1/2" screw (Screw A)
throught the center hole. Put a couple of washers underneath the blade to
lift it off the board and another washer above the blade.

3) Take two pieces of insulated bell wire about 5" long and remove a 1" piece
of the insulation in the center of each of them.

4) Wrap the bare section of one of the wires around the razor blade screw between the bottom washers that hold it off the board. These two pigtails will be used for connecting to the headphones and ground.

5) Put a couple of washers on another 1/2" screw, and mount it (loosely) to the board about 1/2" away from the edge of the blade.

6) Wrap the bare middle section of the other 5" wire around screw B. These two pigtails will be connected to the headphones and antenna.

7) Get a 3/4" piece of pencil lead. I recommend carving up a wooden pencil (remember those?) so you can get a good strong piece. Sand one end flat (blunt).

8) Cut a bare piece of bell wire, about 2 inches long. Now wrap one end of the wire around the pencil lead about 5 times. (Now you know why the lead needs to be fairly "fat".) The lead should protrude from the bottom of this little coil of wire.

9) Connect the other end of this wire to screw B.

10) Tighten both screws.

11) Bend the piece of wire holding the pencil lead so that the blunt end of the lead rests on the surface of the razor blade with as much surface contact as possible.

12) Connect one of the wires from screw A to a water pipe and one of the wires from screw B to a long piece of wire for an antenna.

13) Connect the other wire from Screw A to one side of the headphones. Connect the other wire from Screw B to the other side of the headphones. (Sorry, I don't have the specs on the kind of headphones to use; I had a cheap pair and they worked fine.)

14) Listen.

To tune the radio, carefully wiggle the lead (or wire holding the lead) and move it around the surface of the razor blade. Let go when you hear music! You should be able to pick up local AM radio stations.

Have fun! Report back if it works!

- Craig, AA0ZZ

I did that as a kid in the 50's. I believe you have to use a razor blade with a blue coating (I think it's the special coating that is the semiconductor). I think I saw an ad for such a kit in the Antique Wireless Supply catalog (Pheonix, AZ I think).

A new supplier of Microwave and RF components.

Sea-Ward International (SWI), based in California, supplies microwave transistors, RF components and amplifiers made in China.

SWI also supplies silicon and GaAs wafers and provide foundry services.

Other products are available. You can check the SWI home page at:

http://www.best.com/~mkyady/swi1.html

or e-mail at:

Message-ID: <31E1CC70.41C6@normal.stat.lsu.edu>
Source record: 104260

I just finished building a AR-1 (Aircraft receiver) Kit capable of
tunning between 118 -136Mhz. But I not able to tune those frequency. I
am getting the FM bands, when I adjust the tuneable inductors L6&7.
I would appreciate any help from a person who has sucessfully build this
kit.
Thanks in advance.
Sanjay

4281. Amplitude modulate Minicircuits VCOs ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-08 00:00:00 UTC
From: chrise@n0jcf.com
Message-ID: <4rsjbh$tk9@n0jcf.com>
Source record: 104261

I'm wondering if anyone has played with these VCOs that they
are now advertising with coverage up thru 2 GHz... and
particularly if anyone has amplitude modulated them ??

I'd like to AM modulate a 1 KHz tone (so that I can make
a little sig gen for use with my old HP 415E swr meter)...

I was wondering if I could just inject the 1 KHz into the
+V (supply) pin of the oscillator and be able to see it
on the output across the entire range that the VCO is
tunable ??

Am I dreaming ?

Thanks for any suggestions...

73, Chris

I have purchased small amounts of parts directly from Minicircuits. I gave them my company name (which is in the electronics business) so there was no question about that. As I recall, they had no minimum order.

Sometimes, Kent Britisn, WA5VJB of the North Texas Microwave Society has minicircuits mmics available. You might want to check with him.

Good luck.

Hello Jay:

This problem comes up from time to time, and I tell people to consider rewiring the amp for a 24V filament voltage (use a 24V 2A transformer) and try a set of 24LQ6's, which are sold by antique electronic supply for $8.50 or so each (not quite $7 but still a pretty good deal). Alternatively, try 31LQ6's, and put the new 24V xfmr in series with the existing 6V filament winding.

Either way, this lets you use tubes that are still plentiful and rather cheap. I've been using a set of four ECG/Philips 31LQ6's in a Dentron GLA-1000B for some time now and they work very well - they are the same except for filmemt voltage and were very cheap (4.50 each) when I bought them last year on sale.

Just remember to clearly mark the amplifier so someone in the future doesn't plug (valuable/rare) 6LQ6's in and blow the filaments. A strategically placed fuse would be cheap insurance.

Hello Richard:

These tubes in your amplifier use to plentiful because the TV industry used them as horizontal sweep tubes in their TV set designs. But not no more. So the good old days of 7 dollars each has long gone.

Contact RF Parts Co. 435 South Pacific Street San Marcos CA 92069, or phone 800-737-2787 for ordering. Last I looked they were 49.95 each. Also ask for a free catalog, its a good referance source for this stuff.

Good luck.

Jay.

I have also used other voltage controlled attenuators with the same results. The Attenuators can provide as much as 40 dBs of modulation range.

You can try http://user.itl.net/~equinox/4cx.html
for plans for a six meter amp.

http://user.itl.net/~equinox/ has a bunch of other 50 MHz stuff, too.

-hello
i think there is a big possibility that you will make fm if you mod the
+ supply line, i would suggest that you take the output through a diode
attenuator circuit and impress your audio on the diode bias

Generally, the application of modulation to the +V supply of a VCO causes more FM than AM (called frequency pushing). If you can stand FM and AM at the same time, your idea will work. If you just want AM only, I would do something like a PIN diode modulator or balanced modulator at the VCO output.

Hope that helps

Steve Muther WF6R

4295. Single Band HF Amplifiers

Newsgroup: rec.radio.amateur.homebrew

While CW is not my favorite mode, I have used an Icom IC-2AT with an
old "key" to send CW and with a oscillator to sen MCW. Never had any
problem and still use the HT. I also have doen the same thing one on
my IC-28A and it worked fine also. Most modern, no TR relay, radios
should not be damaged by this. (Just a guess on my part). Of course
it is odd to have CW inverted by the HT going quite with the CW signal,
and the "hiss" with no signal there....
MCW is better because you can "close" the squelch.
Have fun

Let's talk a _MAN'S_ 6M amplifier!! The 1985 ARRL handbook has a grid driven
6M amp using a single 4-1000 tube, with swamped grid drive, so it claims
10 watts in, 800 watts out using a 3500V power supply and 900V on the screen.
Don't see why you couldn't push it harder (the tubes are cheap and rugged).
Looks real simple mechanically!

For what it's worth:

I have posted my share of questions in this ng, and answered several as well. I don't know as I have ever received a hostile response to a legitimate technical question here, but I can tell you that elsewhere on the net, jerks await at every turn.

I, too, have posted questions about certain circuits or pieces of equipment, and had some nitwit write me a flame accusing me of being lazy, and directing me to "figure it out" by myself. (This was in addition to the standard aol bigotry which, at this point, I am growing very tired of.) Ironically in further conversation with him, it became obvious that I had forgotten more about the subject matter than he probably ever knew. So, while he had no idea what I was really asking, and while he didnt couldnt respond to my post on a technical level, he somehow found the time to be an a**hole.

I for one think this forum (and the other newsgroups as well) are about the exchange of ideas and information. I have never turned my back on anyone who I could help, and certainly have never dumped on them for asking a question.

I think what the internet needs, in general, is a little bit more civility, and little more kindness. Its easy to forget, while pounding on an inanimate keyboard, that there are human faces at the other end of the wire. We all forget.

Lets talk about "homebrew" topics now, shall we?

4302. Q: Injected Carrier Detection in Receiver?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-10 00:00:00 UTC
From: akent@bga.com
Message-ID: <4rv36u$s12@news3.realtime.net>
Source record: 104132

I am relatively new to analog, so please bare with any ignorance herein.

I am toying with the idea of a full duplex data channel using a single carrier frequency. In this idea, the master transceiver would inject a carrier along with SSB data. The slave transceiver(s) would lock onto the carrier both in frequency and phase, and they would be locked, using synchrodyne (no heterodynes at this point). The slave transceiver would then be able to transmit data using the same carrier on the other sideband back to the master, who uses the original phase to demodulate this back channel data.

Here is the Q.
Is there a reliable way to lock the slave to the master carrier frequency? I am currently using an opamp with a crystal to serve as a very narrow band pass filter. This works a bit, but the received data is part of the carrier, as the Q is maybe not high enough. I have tried PLL's, too.

Any ideas?

Thank you for your help.
Kent

Hello Everyone,

I want to build a 6 m linear, this linear should have at least 200 w PEP output if not more, I don't mind if it is solid state or valve based. A low driving power (2 w) would be great.

I wonder if anyone out there in hamland can help with circuits or suggestions ?

Thanks for the information !!

I've been looking for (and still am) a large blower too cool a 3CX5000A7 tube.
I've found a number of commercial companies that sell such fans, although they are
obviously much more expensive than surplus ones. Anyway, if anyone else is looking
for a new fan, you should find what you are looking for in the list below.

If anyone has a 7" (or more) wheel diameter centrifugal fan, running at more than
2600 rpm, let me know. I'll pay any reasonable price for the right item.

Airflow Developments Ltd,
Lancaster Road,
High Wycombe,
Buckinghamshire,
HP12 3QP,
ENGLAND.
(They do a decent range, and have a *very* informative catalogue)

Air Control Industries (ACI),
Silver St,
Chard,
Somerset,
TA20 2AE,
ENGLAND.
Tel: 01460 67171
Fax: 01460 61700
(They have a good range, and for the one application I have are quite reasonably priced.
Unlike Airflow Developments (above) they make some pretty big fans (ie 2 kW
motors) with single phase supplies.)

Halken Electrical Ltd,
Unit 17,
Zennor Road Industrial Estate,
London,
SW12 OPS.
Tel: 0181-673-7322
Fax: 0181-673-8065
(They seem to aim more at the air-conditioning type applications. They
appear only to sell fans made by other companies, and seem to have
little useful technical information. They sell sepparately fan wheels, housings and
motors).

Nicotra UK Ltd,
Masbrough Street,
Rotherham,
S. Yorkshire,
S60 1ER,
England.

Tel: 01709-376747
Fax: 01709-362031
(Do a large range of direct drive fans. Cheapest I found for cooling the 3CX5000A7)

Secomak,
Honeypot Lane,
Stanmore,
Middlesex,
HA7 1BE,
ENGLAND.
Tel: 0181-952 5566
Fax: 0181-952 6983
(They don't do small fans, but do sell some *seriously* high spec and
expensive fans. Good if you need something special, such as multi-stage
units that can pump against large back-pressures. Probably not of use
for the fans typically used by radio amateurs)

Ziehl-Ebm (UK) Ltd,
17-19 Richmond Road,
Dukes Park Industrial Estate,
Chelmsford,
Essex,
CM2 6TL,
ENGLAND.
Tel: 01245-468556
Fax: 01245-466336
(This is a German company. Range seems a bit limited at the high end -ie nothing
at all to cool a 3Cx5000A7 tube.)

Dave Kirkby G8WRB
Dept of Medical Physics,
University College London,
11-20 Capper St,
London WC1E 6JA
Tel: 0171-209 6406

>power out in the VHF and UHF ranges?

The device input and output capacitances present lower and lower impedances as frequency increases. This effectively shunts signal power, requiring more drive, and delivering less output power to the load. Or looked at alternatively, the time constant for charging and discharging the input capacitance becomes long with respect to a cycle as frequency increases, the capacitance thus doesn't get fully charged on each driving cycle, and less peak to peak gate voltage is available to the active device as a result.

This assumes a constant impedance driving source. If you lower the driving source impedance as frequency increases, you can reduce the time constant of the gate circuit in step with increasing frequency and maintain peak to peak drive voltage. There are practical limits to how low a driving source impedance you can use, however, so this only goes so far.

A similar thing happens on the output side, with the device having to charge the output capacitance, and the load having to discharge it, in the space of a cycle. The peak to peak output voltage falls, and according to P=E^2/R, power output falls as well unless you lower the load R in step with increasing frequency. Again there are practical limits to how far you can go in that direction.

You can "tune out" the device capacitances with series inductance, but this is inherently narrowband, and also can lead to instability if you aren't careful due to phase shifts which may induce the circuit to become an oscillator. The best thing you can do is select devices with low input and output capacitance, but that means gate area becomes very small at higher frequencies and you run into power handling limits.

At very high frequencies, transit time of the majority carriers becomes a factor. To minimize that, you want a very short channel, but that also limits power handling (because it lowers the PIV punch through limit). In some cases, you can take advantage of transit time by using "slow wave structures", IE the principle behind the traveling wave tube. You can even do that with solid state devices using a circuit called a distributed amplifier. It

gets pretty complex pretty quickly, however.

>being reminded. I had the book at one time but must have gotten rid of it
>years ago.

Jim, you'll find the project starting on page 194 of the 1962 Handbook.
Each single band amp uses a pair of 813s in parallel, with a link coupled
grid circuit and a Pi network output circuit. Filament and drive power
are switched to the active amplifier, HV, screen voltage, and bias are
maintained on all of them all the time from the common power supply.

I don't think much of the idea of switching filaments on with HV and
bias already present. 813s are tough old birds, but that's still abuse.
I'd consider a time delay relay in each RF deck that kept screen voltage
off the tubes until their filaments warmed up.

The author doesn't mention this (I guess he assumed everyone would
realize it), but the meters are hot in this design. They need to be
behind a protective insulating barrier. The picture shows the meter
panel recessed behind a glass window, and you should take care to
duplicate this safety feature.

If you are having a problem with keeping the other sideband out of the carrier phase-lock circuitry because your filters aren't sharp enough, then I expect you will also have a problem with the wrong (that is, supposedly supressed) sideband jamming the incoming correct sideband. Repeaters are full duplex, and they use of order 1 MHz offset between incoming and outgoing signals - say about 1% of the carrier freq - and nevertheless need triple cavity filters for 100 dB isolation to keep from jamming themselves. If your data is ~ audio freq., then the sidebands will be only kHz apart - a small fraction of 1% of the carrier bandwidth, perhaps - with correspondingly more difficult isolation requirements. Cell phones get by by using ~ 60 MHz offset between TX and RX, which is nearly 10% of the carrier freq.

You mention not wanting to do heterodyne. Why not? If you have this sideband here, and that sideband there, both phase locked to some carrier, what, philosophically, distinguishes that from having two carriers a good ways apart, and phase-locked to eachother? By modulating these "different" carriers, you avoid having to suppress one of the sidebands at each end - they're not necessarily right on top of one another.

You could *make* the sidebands not be on top of one another by putting one well outside of the other - say, one at audio and one at 1 MHz, use DSB transmission both ways, and use simple low-pass or high-pass filters at each end, but now there's "another" carrier anyway, the 1MHz you mixed with the other data stream to get it way away from the first bunch of modulation, so I see this as nothing gained over simply starting with two carriers in the first place.

These can still be phase-locked to eachother: divide "the" carrier digitally by, say, 16, and mix it in, so one carrier is at f and the other is at (15/16) f, and they're still phase-locked, but now nice and far apart - perhaps out of easy jamming distance from one another, and you don't have to sweat the filtering.

I'd guess that you'd get more FM modulation than AM modulation.
This is because, even if the varactor diodes are AC coupled, a
change in the oscillator operating point is likely to cause some
change in tank capacitance.

How about following it with a buffer stage and modulating that?

4316. [Q] AM-to-shortwave receiver conversion question

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-10 00:00:00 UTC
From: pkinnes@CyberRamp.net
Message-ID: <4s1dj7$8d5@newshost.cyberramp.net>
Source record: 104146

A number of years ago (around 1991 or 92), I remember seeing an article in an electronics magazine about converting a Radio Shack AM-only "Flavoradio" for shortwave use. The modification involved removing the ferrite rod antenna from the radio and replacing it with an airwound coil, with a number of taps selected through a multiple-position rotary switch.

I remember modifying one of these and being astounded by the results. My little receiver served me well for many years, but in my last move, it kind of got lost among all the boxes. Rather than rooting through all my boxes to find it again, I would prefer to build another one.

This then brings me to the point of this post. I remember that the form of the air-core coil was approximately 1 inch in diameter (I think I used a film cannister), but I don't know the number of turns of 30-gague wire per tap. I'd much rather get a number on this one than to just use the "try-it-and-see" method.

Alternatively, wouldn't just using an air-core coil made of rigid, widely-spaced turns, tapped by an aligator clip work just fine? If so, then does anyone know where I might be able to find a source, aside from having to canniballize older radio equipment to get it?

Thanx in advance for any help!

Thoriated tunsten tubes do not require delay of voltage application. They are not subject to emission stripping of the cathode by excessive current for the temperature. They simply saturate, and no harm is done. A thoriated tunsten tube's circuit can actually be in the operating mode as the filament is turned on without harm to the tube.

Only indirectly heated metal oxide cathode tubes like the 8877 require warm up delays. They are subject to emission deterioration if operated beyond current limits established by cathode temperature and cathode surface area.

If that isn't reason enough adding a delay circuit for the few seconds warm-up required by an 813 is a waste of time and effort. By the time you hand leaves the power switch the tube will be ready to operate.

Better yet, move the meters to a safe electrical location at the grounded side of the supply and protect the grounded supply rails from meter opens with diodes.

Can anyone knowledgeable in pc board CAD drawing point me to
a decent shareware Gerber file viewer ?
The one I have now is quite crude...it shows all lines as the same
regardless of their thickness. The program is okay for checking
general connectivity and placement but not so great with detail.
I'd like to see if there is something better out there.
I would consider commercial software too if the price is reasonable.

(The schematic/pc board package I use shows multi-layers in x-ray
perspective rather than mirrored images as you would see it by flipping
the board. A gerber viewer really helps to see what the board will
really look like from the plots.)

Many thanks !

Actually, I found my own answer today! I happened across it, and it
works, in wire at least! I will need to see what distance works with
the system using air RF. Phase shift with distance may be a problem.

The whole idea behind this toy idea is to use as little as possible of
the RF bandwidth. My theory is that if you bandwidth limit data, pass
each direction over one SB using a carrier, you effectively halve the
bandwidth on the air. From what I have seen, FM, AM, DSB, and every
other method that everyone uses takes up twice the bandwidth of the
spectrum relative to this idea.

>Repeaters are full duplex, and they use of order 1 MHz offset between
>incoming and outgoing signals - say about 1% of the carrier freq - and
>nevertheless need triple cavity filters for 100 dB isolation to keep from
>jamming themselves. If your data is ~ audio freq., then the sidebands
>will be only kHz apart - a small fraction of 1% of the carrier bandwidth,
>perhaps - with correspondingly more difficult isolation requirements.

It works now, albeit with wire.

>Cell phones get by by using ~ 60 MHz offset between TX and RX, which is nearly
>10% of the carrier freq.

>You mention not wanting to do heterodyne. Why not?

If I can get this system working at about 16 to 25mhz, then it should
also work at any higher frequency. I would like to make it work at HF
and then play with bumping the frequency up.

>If you have this
>sideband here, and that sideband there, both phase locked to some carrier,
>what, philosophically, distinguishes that from having two carriers a good
>ways apart, and phase-locked to eachother?

Spectrum bandwidth. A single carrier will not offend the 'other'
frequency, hopefully.

> By modulating these
>"different" carriers, you avoid having to suppress one of the sidebands at

>each end - they're not necessarily right on top of one another.

I agree that suppressing sidebands is a relative pain, but, if it
utilizes bandwidth better, and you can do it cheaply, why not?

>You could *make* the sidebands not be on top of one another by putting one
>well outside of the other - say, one at audio and one at 1 MHz, use DSB
>transmission both ways, and use simple low-pass or high-pass filters at
>each end, but now there's "another" carrier anyway, the 1MHz you mixed
>with the other data stream to get it way away from the first bunch of
>modulation, so I see this as nothing gained over simply starting with two
>carriers in the first place.

Again, my argument, etal.

>These can still be phase-locked to eachother: divide "the" carrier
>digitally by, say, 16, and mix it in, so one carrier is at f and the other
>is at (15/16) f, and they're still phase-locked, but now nice and far
>apart - perhaps out of easy jamming distance from one another, and you
>don't have to sweat the filtering.

The problem with digital (IE PLL), is that ultimately you have to
convert digital back into a single frequency. This is no trivial
matter. I have used all kinds of methods to achieve a real pure sine
from a square wave and it COSTS money to do.

The whole idea in this toy endevour is to produce a very minimal
relative spectrum usage full duplex data channel, using VERY cheap
components. I found that you can modulate digital at any frequency,
and not need any exotic modem's, DSP's, etc. You just play with
digital edges. The spectrum thanks you too.

The problem I see with this is that the local transmitter would
overwhelm the local receiver, IE the locally generated signal
would be so much stronger than the signal received from the distant
station that it would dominate the AGC and block reception of the
distant carrier.

>Here is the Q.

A squaring loop can recover the carrier without being bothered by
the modulation.

Source record: 104153

Because it may not be too well known, I point out that the scales of meter movements are not very linear. The scales of good movements are individually matched or drawn. I know of one important manufacturer that had several versions of scales already printed and selected the one fitting to within the specified accuracy. Hewlett- Packard did (and probably still does) calibrate its precision meters individually with a computer controlled scale drawing machine (it was done photographically in the past but might be handled by LASER printing today, or something of that sort.)
Just dividing a new scale into uniformly spaced arcs is likely to lead to some errors, though I will hazard no guess how big these will be. If I needed accuracy I would make a linear scale, mount it, and feed the meter accurate currents. Then make a corrected scale based on the readoff data. For crude indicators (S-meter, for example), it is not likely to be worth the bother.

Hi Mike!

It looks as though you're wanting to come up with some sort of
microwave communications for house-to-house use which doesn't
come with unsightly dishes on masts. Maybe if you come out and
describe what you're really trying to do, you might get some more
specifically useful help.

In general though, you're going to have no fun at all trying
to pump microwave signals through a sloped roof.

Think about it for a bit...

Where does the part of the signal that doesn't make it through
the roof go? It gets reflected *DOWN*. This can generally be
regarded as A Bad Thing=AE, especially in the case of residential
structures.

4326. Re: Q Injected Carrier Detection in Receiver?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-11 00:00:00 UTC
From: wb9mjn@uugate.wa7slg.ampr.ORG
Message-ID: <31508@uugate.wa7slg.ampr.org>
Source record: 104156

Hi Kent,

Thats an interesting idea. Certainly a PLL can be made with a narrow enuf lock range to lock onto the carrier. Here, the Q of the loop is in the low frequency loop filter.

But, that s not the real problem with the idea, which is, that the spectrum of the transmitter does not end at one sideband. And the residual signal in the opposite sideband would seriously compromise the reception of any signal.

For reception near the natural noise limit, the reciever must have less than 130 dBm noise floor, approximately. A transmitter operating at 1 mw, or 0 dBm needs to have 130 dBm noise output at the receive frequency. Being the oposite sideband, there really is no practical way, in the present technology, to attenuate 130 dB, the oposite sideband. Most SSB transmitters have oposite side band attenuation specs of around 40 , maybe 50 dB.

Additionally, SSB demodulation, by the filter, or phasing methods have similar oposite sideband rejection capabilities. This is possibly usable with a low capture ratio data demodulator, if the oposite sideband and desired sideband were equal levels. But, even without transmitter noise, the desired sideband (received sb) and the oposite side band (transmitted sb) are not equal. Say, u have a 20 dB capture ratio for 10e-6 BER, then the transmitted SB, could only be 20 dB stronger (for a total of 40 dB) than the received signal.

This technigue , with allot of work, might work for tens of yards, is my guess.

To get full duplex, which is a really desireable thing for data, one needs to do a dual banded technigue (with duplexing filters at RF), or time domain duplex (with enforced timeing) at double the data rate (and twice BW and Noise) .

BTW, a simplification of ur idea, would be to use quadrature DSB, rather than SSB. This would greatly simplify the modulators and demodulators. A Kostas loop would then be used for carrier recovery, and there would be no need to transmit carrier. Altho, resyncing periods of no transmitter modul-tion, would probably be needed.

The CAD package I use, Protel, has a built in Gerber viewer. I know there are some shareware viewers out there. You might try the Simtel archive (ftp: oak.oakland.edu) or posting your question to sci.electronics.cad. You might find some good answers there.

Good Luck

Yeah, but not easy to do with the circuit presented (four different
currents are metered, and the B+ voltage). With the multiple RF decks,
and the several different supplies, I think I'd rather have the supply
minuses connected hard to the rack chassis and put the meters behind a
glass barrier to avoid operator contact. That may be a bit more failsafe
than depending on clamping diodes.

Message-ID: <4s3km2$a0i@peabody.colorado.edu>
Source record: 104162

>Because it may not be too well known, I point out that the scales of meter
>movements are not very linear.

They also usually, irritatingly, depend on the angle of the face with respect to gravity. Unless the thing is perfectly balanced, which even fairly nice, commercial meters aren't, gravity pulls "down" on the needle, which results in low readings when the needle is less than half scale, and high readings when the needle is past half scale, and having a smoothly varying sine-like dependence of error on needle angle. Orienting the meter face-up so the movement is in the horizontal plane fixes this, but then if you rotate the meter to show face-forward, the error is WAY more than a needle-width. So those meters with nice skinny needles, lots of tick marks, and a mirror behind so you can line up your eye to avoid parallax - lay them on the floor and look down at them, or else trust that they have been gravity-cancelled and take your chances.

(Or use a DMM. Does making an A-to-D and a display driver count as homebrewing a meter?)

From: chrise@n0jcf.com
Message-ID: <4s3nd3$7a3@n0jcf.com>
Source record: 104164

I am interested in playing with some of these TOKO helical filters for 2m, 222 and 432 in conjuction with some GaAsFET preamps. I have a commercially built preamp (AMPIRE) that has the helical filter AFTER the GaAsFET... this seems cool since it probably doesn't contribute much to the noise figure this way... but I'm wondering what other tradeoffs there are to this method as opposed to putting the helical ahead of the GaAsFET. Putting it ahead would obviously add to the noise figure and put about 6dB of loss before the GaAsFET as well...

Where do guys like SSB Electronics put the helicals in their helically filtered preamps ?

Any comments greatly appreciated.

Test the meter this way....

Lay the pointer flat and zero it with the regulator (zero adjust).

Hold the meter so the pointer is vertical.

Hold the meter so the pointer is horizontal.

It the pointer remained on zero the movement is properly balanced.

If the meter isn't balanced, it was a crummy job or a cheap meter.

Precision meters are ALWAYS balanced (unless someone isn't doing their job) and free from gravity induced errors. They are balanced by sliding little coiled weights in and out (they are at 90, 180, and 270 degrees in reference to the pointer), and using temperature reflowable glue to retain them in place. Fine tuning is done by tweeking the angle of the weights just slightly or adding a tiny dot of glue.

This error also is reduced by increasing meter torque. Assuming all the resistance is in the moving coil, a 1 mA 1000 ohm meter is much less sensitive to balance than a 50 uA 50 ohm meter. With high torque meters, balancing is much less critical.

More important than any of this are effects of a steel panel. Be sure the meter is used in the type of environment it was specified to be used in.

The tradeoff involves understanding the kind of RF environment
you are in. If you have strong out of band signals that could
potentially saturate your preamp or RX, you would be better off
putting the filter before the preamp, assuming its response
rejected the unwanted signals. In that case you would have to
live with the loss.

If you are interested in the absolute maximum sensitivity and
lowest noise, than putting the filter after the preamp is the
best choice but understanding the possibility of overload.
Fortunatly, most GaAs preamps have a farily high input saturation
level and a high P1dB of around +5dBm or more.

The Toko filters you mention are rather high loss. They are
best suited for use between stages rather than up front. For
any front end filter, you might consider home brew interdigital
or cavity types.

-hello
as i read it you are transmitting residual carrier ssb if this is so
then why not try pushing the received signal through a limiting amplifier
as in an fm receiver this should strip off the ssb data and leave the nominal
carrier to use as a locking ref. obviously the data will travel by propagation
a lot further than the residual carrier, for long distance and fade conditions
you could use a slow response pll tuned by sending a locking burst interleaved
between blocks of data and this way you could do away with the residual
carrier
(it works well for colour tv"pal" i don't know about
Never Twice the Same Colour)

Source record: 104169
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Now, no one chatize me for this, ...

BUT ....

If you've seen (or about to see) Independence Day (the Movie) HAM Radio & CW seem to save the day. After all other forms of communications have failed or are unreliable, the message seems to get around the country that the U.S. has a plan that might save the planet.

Unrealistic .... the fact that we'd be able to fend off an interstellar attack.

Realistic .... the fact that HAM radio might be useful IF all forms of communications do fail.

Just the fact that HAM Radio is EVEN mentioned in a movie is very pleasing to me !!! Let alone save the world !!! To think, someone actually knows that it exists.

Of course, if we had these local and DX bands taken from us, it woudn't do much good. Don't totally compare this to the movie though. Use your imagination in what could happen (i.e. earthquake, tropical storm, tornado, war ?!?) More than likely, ARS operators are capable and willing to help there country (maybe world, depending on the situation) when all other ways of communicating are down.

You will have trouble with epoxy in the tube environment. Just look at any of those old television sets that tried to put tube sockets directly on pc boards. The major problem is heat. Tubes, a.k.a. themionic emitting devices, operate at substantially elevated temperatures. I think that you will find that epoxy is not much good over 200 degrees.

I am sorry that I can't make any recommendations for bonding products that have high temperature and high dialectric properties.

Maybe a tube manufacturer might have a suggestions.

Good luck. Jim

4341. WTB: New UHF tuners

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-11 00:00:00 UTC
From: hjohnson@pluto.njcc.com
Message-ID: <yhKvnuoWWVQ4079yn@pluto.njcc.com>
Source record: 104171

Some colleagues of mine are interested in building a *lot* of radio astronomy antenna/recievers for use in the TV UHF region, using TV UHF tuners that can be remotely tuned. Yeah, yeah, I know the technical issues - this is just a request for WHERE they might get a bunch of these, say tens or so at a time, at what cost. Yes, they can strip them out of TV's but they'ed all be different, and not very current in some cases (assuming current=better!). So what is a commercial source for small quantities of these, with some hope of consistancy, and at what price?

I would also appreciate some useful reference book or manufacturer's publication that discusses the technical merits of these tuners. Most articles get dated on this subject. I know the short version, about noise issues and so on - I'm looking for a current and deeper treatment.

Thanks! BTW, I've had a lot of help on some related projects via this maillist, so I appreciate this resource.

>Where do guys like SSB Electronics put the helicals in their
>helically filtered preamps ?
>
>Any comments greatly appreciated.

There are basically two reasons to use preselection filtering.
The first is to suppress images in the first mixer, and the
second is to protect the first RF stage from overload caused
by out of band signals. In the first case, the filter can go
in front of or follow the first RF stage, in the second case,
the filter must go in front of the first RF stage.

Assuming the latter is the primary reason for the preselection
filter, to minimize noise figure degradation, a filter with a low
insertion loss would be used. The Toko helicals have a relatively
high insertion loss, so they are a poor choice to go in front of
the preamp. There are helicals with lower insertion loss, and
there are interdigital and cavity filters with even less insertion
loss. These would be preferred as front end preselection filters
to protect from front end overload.

The SSB Electronics preamps put their (low insertion loss) helicals
in front of the GASFET. Most receivers which include helical
preselection filters also put them before the first RF stage.
Examples are GE and Motorola commercial two-way equipment such
as the Mastr II and the Micor.

If the first RF stage active device has a very high IP3, you can
get away with putting the filter after the preamp. About the only
reason you'd want to put a helical here is if the first IF is a
relatively low frequency so that image suppression requires a
fairly steep filter response. Otherwise you'd use a simpler,
and lower loss, filter (typically serving as part of the matching
network of the active device).

One way to get a high IP3 is to bias the active device to have a high standing current. CATV trunk amplifier transistors are often used for this, with a standing current of 100 mA or more. The typical GASFET chosen for a low noise preamp can't handle standing currents in this range, but power GASFETs have recently declined in price and have been used in this way. In one of the _Microwave Update_ conference proceedings is an article on this topic.

4343. FS: HP 1740A 100Mhz Oscilloscope

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-12 00:00:00 UTC
From: Dan Ellefson <sl3jj@cc.usu.edu>
Message-ID: <31E6C0F7.1C50@cc.usu.edu>
Source record: 104032

FOR SALE: HEWLETT PACKARD 1740A ANALOG 100Mhz OSCILLOSCOPE

The unit is a two channel 100 Mhz oscilloscope with two external triggers.
It comes with two HP X10 probes that came with the scope and two B&K X10/X1 probes
that I bought brand new. All the probes are rated at 100 Mhz. The scope is capable
of deflection factors from 1 mV/div to 20 V/div on the vertical scale and 5 ns/div to
20 s/div on the horizontal scale. The scope also has a delayed sweep feature which is
set by a precision control knob which allows delay settings of 50 ns to 20 s. Other
features of the 1740A include simultanous display of both input channels and the trigger,
bandwidth limit control for attenuation of signals above 20 Mhz, plotting channel A vs B,
choice of 50 Ohm or 1 Megohm input impedance, Chop mode, Alt mode, A+B display, channel
B inversion (this allows A-B display), trigger selction of channel A, B, or external,
trigger level control,LF and HF reject on external trigger inputs, AC, DC, Internal and
External triggering, External /10 triggering, and many more features.
Documentation for the scope is included and consists of the 1740A Operator's Guide
and the 1740A Operating and Service Manual with includes detailed schematics of the scope's
internal circuitry.
The scope comes with a soft leather pouch with a velcro closure that is attached
to the top of the unit allowing storage of manuals and probes. A hard plastic cover is
also included that fits snugly over the front face of the scope to protect the controls
and CRT.
The scope is in very good condition with no noticable dents or scratches. I've had
the scope for quite some time and have been very pleased with its performance and the great
many features that come with it. The reason that I am parting with it is because I recently
purchased a brand new $4500 scope (ouch....) and have no need for two scopes.

PRICE: $450 (buyer pays for shipping)

4345. AM Modulating Tube Finals With Solid State Audio Amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-12 00:00:00 UTC
From: jeffd@coriolis.com
Message-ID: <4s6rit$qlc@globe.indirect.com>
Source record: 104034

Here's a notion I had a long time ago and haven't gotten around to trying...

AM Modulation transformers are really rough to find these days, but the thriving tube audio business provides audio output transformers to match nearly any tube output impedence to an 8-ohm load, at almost any power level you'd care to try.

Now...turn that around: Could we generate audio power with one of these solid state audio amp modules (say 20-50 watts) and pipe the audio into the 8-ohm side of one of those output transformers, and then use the other side as the modulating output in series with the plate of a Class C tube final like a 6146B?

Every solid-state audio power amp IC or module I've seen works into either 4 or 8 ohms. I can't see why we couldn't use an output transformer "backwards" to generate audio power at the impedence a tube final like a 6146 or 811A would like.

I LOVE the audio quality of plate-modulated AM, and this would imply an easy way to make a good quality 50-100W AM transmitter without having to grub for a used modulation transformer.

Has anybody tried this? Are there any nonobvious gotchas I haven't thought of yet?

Do let us know.

After, always. There is no point in marketing a pre-amp with
a 6dB noise figure. You can make lower loss filters, but usually
the effect on the noise figure is too much. The input is mostly
a capacitor and and inductor matching circuit.

An exception are PMR radios, where a bomb proof front end and
an 8 dB noise figure is more impotant than a 2dB noise figure
radio that won't receiver anywhere near a transmitter.

With clever design yeilding a high intercept point and a high
Q input circuit plus a helical or stripline filter after the
GaAsFET you can make an LNA good enough for amateur use.

Mike

As you mention the helical filters have a substantial insertion loss.
Putting one ahead of the preamp will render ther receiver completely
deaf. They are designed to have very good out-of-band attenuation
and will be usefull, if put *after* a stage with sufficient gain.
Normally the first transistor is not overloaded by out-of-band
signals, the antenna and the matching circuit will provide enough
selectivity. I have however seen a 1296 preamp with a high pass filter
added in the front, to stop TV signals. This is however specially
designed to have no more than .1 dB attenuation. Incidentally, modern
designs use high power gasfets, which are well suited to handling high
signal levels.

Hi Bob,

I used to be Engineering Manager at a company that made meters (among other things).

In article <96193.094914IFF161@DJUKFA11.BITNET>, Bob Mueller <IFF161@DJUKFA11.BITNET> writes:
>
>Because it may not be too well known, I point out that the scales of meter
>movements are not very linear.

I wonder waht type of accuracy your are reffering to? We manufactured meters that were within 1% at full scale and half when calibrated at 3/4 scale. At 3/4 scale they were dead on at room temperature.

Let's assume we have a conventional 1% FS meter reading 1000 uA (one mA). The net error at any point of the scale would be less than 10 uA. If pickets were placed every degree on a 100 degree movement, the maximum error would be one picket anywhere on the face of the meter. If the scale arc was three inches long, the pickets would be around .03 inches apart. If the pointer of the meter was .05 inches from the scale, parallax would be a bigger problem than metering error.

>The scales of good movements are individually
>matched or drawn. I know of one important manufacturer that had several
>versions of scales already printed and selected the one fitting to within
>the
>specified accuracy. Hewlett- Packard did (and probably still does)
>calibrate its precision meters individually with a computer controlled scale
>drawing machine (it was done photographically in the past but might be
>handled
>by LASER printing today, or something of that sort.)

We only did that if the scale was a large mirrored scale. Without a very large mirrored scale, errors caused by the person's method of reading the scale dominated the error. Perhaps HP was compensating for circuit variations (such as non-linearity in a RF detector) rater than actual meter variations? If it was actual meter variations, the meter manufacturer would be the one changing the scale, not H-P.

We did that in 7 inch mirrored scale 1/2 percent meters.

> Just dividing a new scale into uniformly spaced arcs is likely to lead

>to
>some errors, though I will hazard no guess how big these will be. If I
>needed
>accuracy I would make a linear scale, mount it, and feed the meter
accurate
>currents.

That's very true. The characteristics of the movement vary with the construction of the "magnetic window" surrounding the motor coil. While good quality movements track very closely from meter to meter in production, you shouldn't do a scale on a movement you've never plotted before by measuring FS and dividing the scale into equal divisions.

1% of FS is easy to do in production without custom selecting each scale, and 1/2 percent is possible. Scales less than 1/2 percent require either custom plotting or tight control of components that control the flux density in the area of the motor. A 1/2 percent meter requires many hundreds of pickets and a large mirrored scale to be useful, the error would be a maximum of 5 microamperes on a 1000 uA (1 mA) meter WITHOUT using a custom scale for each movement.

I have seen many responses to this, and agree with most. I would add that that one can derrive a rule that says P f^2 R = constant.

where P=power, f=frequency, and R = output resistance.

So going up in frequency by a factor of 10, reduces your output by a factor of 100. I've seen graphs of power vs frequency, and this seems to follow over many orders of magnitude.

I can't recall the exact derrivation of this, but if anyone is interested, I have it somewhere.

Any answer depends greatly on:
1) Exactly what do you want to do?
Do you want both electrical analysis/synthesis or simply
some sort of artwork layout package?

2) How much money are you willing to spend?
You can find something for any budget:
0 - $100 Look for demo's, Freeware, shareware.
Adapt general drawing programs to generate artwork

$100 - $1K Look for shareware for electronic analysis.
Use low-end CAD or PC board layout software.

$1K - $10K Touchstone, Eagleware, Super-Compact, etc for analysis
Lots of PC board Layout software and CAD.

$10K - ? You have that much money and don't know what to do
with it??!! :-)

>these, say tens or so at a time, at what cost. Yes, they can strip them

A good source for these might be Sharp. They might be able to
sell in quantities as small as 1000 or even 500, if its identical
to something they're already making. If you want to open them up
and modify them for non TV frequencies, however, you will have to
do some arm twisting to get internal schematics. In small
quantities, they might charge $25 to $50.

Another idea is to look through jobber catalogs like MCM
Electronics in Ohio. The catch there is that you have to buy
all the tuners you ever need at once if you want to be sure that
they will be identical.

Hi!

I recently found a 24VDC power supply in my garage that
came from an old monitor. I think I'm going to use it
to power a cheap little radio for base station use. (It's
a mobile radio, btw)

I'm thinking along the lines of using one of the TO-220 case
voltage regulator (maybe adding some big caps for ripple)
to bring the 24V down to 12 or 15 volts. My concern is that
12V may not be sufficient for full power transmit since the
radio expects 13.8. (The radio only pulls 1.5A at max
modulation, so it doesn't need a ton of juice)

There is a very common 15v regulator available, would that
be too far above the 13.8? I'm not aware of any 13.8v
parts.

Any help much appriciated!

You can raise the voltage of the common 12 volt three terminal regulators (7812, LM340, etc) by putting diodes in series with the common terminal to chassis (note that you have to use an insulated mounting for the tab, IE a mica washer). 3 diodes will increase the voltage by 1.8 volts (0.6 volts per diode drop).

Note that the regulator will have to drop 10.2 volts to get from 24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it very well. A TO-3 cased regulator might be a better choice (again use a mounting kit, you can't ground the case). The added diodes need to be rated for the current as well.

Hmm, let's see. 24 VDC on the source, 1.5 amps, and 15 vdc out, and a to-220 case egh? I'd start saving for a nice service manual on that radio if i were you. When that regulator blows from the 14 watts you attempted to dissipate it may fail shorted and put 24 volts into your mobile. Either that or plan on some pretty fancy cooling system for that puppy, it's going to get screaming warm.

Take a look at the junction to case thermal resistance of the regulator you are planning on using and do a few simple calculations before you put this thing together.

Garry,

The LM338K variable voltage regulator (5A) should be OK for this
purpose; two resistors set the voltage for you. I use these to make
13.8v gel battery chargers and they work fine. BTW I float 12v batteries
across all my 13.8v supplies as a protection against regulator failure.
Makes a great UPS too! Don't forget the reverse connected diode across
the top of the regulator if you use it for battery charging - if the
device gets volts on its o/p with none on its i/p, like when the mains
fails, it blows. If you'd like the circuit I use, I'll snailmail it to
you.

Include a dropping resistor between the supply and the regulator to
minimize the voltage drop (and subsequent power dissipation) across the
regulator.

>>then I expect you will also have a problem with the wrong (that is,
>>supposedly supressed) sideband jamming the incoming correct sideband.

And you could avoid the whole problem by simply using two half rate
signals on the two sidebands, both in the same direction. (This is
a thought experiment, as there are almost certainly better ways of
doing things.)

>The whole idea behind this toy idea is to use as little as possible of

>each direction over one SB using a carrier, you effectively halve the
>bandwidth on the air. From what I have seen, FM, AM, DSB, and every
>other method that everyone uses takes up twice the bandwidth of the
>spectrum relative to this idea.

I think you are taking too simplistic a view of the technology of
transmitting data over an analogue channel. Amateur equipment may well
take a simplistic view, but that is because it has to be done with
relatively low technology. The technology needed for your system would
be very complex over a lossy radio channel. (Incidentally, theoretically
there is no reason why you need to use the other sideband for the return
path, as on a radio path, in theory, and on a telephone circuit, in
everyday use, you can subtract out your own signal completely.)

One of the approaches used in phone and radio modems to get round your
problem of sidebands is to send half the bits with one carrier phase and
half the bits with a 90 degree shifted carrier. This is effectively
done as double sideband suppressed carrier. I guess there is some
redundancy to allow carrier frequency errors to be tracked and there may
even be pilot carriers in radio systems. Note though that by suitable
coding you don't need an absolute phase reference, you use phase difference
from signalling unit to signalling unit (all of the medium and
high speed modem codes do this).

>It works now, albeit with wire.

As I hinted above, with wire you can, and all modems from V.32 upwards do, get the reverse channel in the SAME frequency range as the forward channel, so your system is only using half of the capacity of the wire link.

>I agree that suppressing sidebands is a relative pain, but, if it
>utilizes bandwidth better, and you can do it cheaply, why not?

Doing it cheaply is the problem. Better modulation schemes with wider frequency separations between send and receive are a much more practical solution.

Incidentally, I sense a tendency to think in terms of bit rate equals baud rate. In an ideal world, you can get any given bit rate into an arbitrarily small bandwidth (the V.34 modem you are probably using is getting 28,800 bits per second into somewhat less than 3,000 Hz of bandwidth. Your simple AM suppressed carrier model will probably only get rather less than around 6,000 bits per second into this bandwidth and a realistic figure would be more like 3,000 (given that real telephone channels are not ideal 3.1 kHz channels, the practical limit is around 2,400 for baud rate = bit rate and analogue technology.

From a theoretical point of view, you need to consider a combination of bandwidth and signal to noise ratio. (The ultimate limit on modern telephone systems is set by the quantisaton noise from the PCM coding.)

>
>
>The problem with digital (IE PLL), is that ultimately you have to
>convert digital back into a single frequency. This is no trivial
>matter. I have used all kinds of methods to achieve a real pure sine
>from a square wave and it COSTS money to do.

The only place where you need a pure sine wave is for the transmitted signal, and that will normally have the harmonics well separated allowing much simpler filters than those needed to knock out a carrier at ZERO frequency offset (baseband digital data extends down to zero, not the 300 Hz of speech, although by scrambling, you can even out the power across the frequency range, and by bit stuffing and more general run lenght limited codes you can sacrifice a few bits to remove the zero frequency component altogether).

For mixing and synchronous detection, you may well WANT a squarewave!

Actually the presence of low frequency components means that you can't construct a filter which won't also damage the signal. You have to use codes which have a higher baseband spectrum, and therefore a wider RF one, relative to your pilot carrier, in order to filter them with real filters.

>The whole idea in this toy endevour is to produce a very minimal
>relative spectrum usage full duplex data channel, using VERY cheap
>components. I found that you can modulate digital at any frequency,
>and not need any exotic modem's, DSP's, etc. You just play with

>digital edges. The spectrum thanks you too.

All the above has assumed that you are using shaped pulses. Raw
square pulses will require rather more bandwidth. Or are you talking
about differential coding?

>If I can get this system working at about 16 to 25mhz, then it should
>also work at any higher frequency. I would like to make it work at HF
>and then play with bumping the frequency up.

Actually you need to start at VHF and work downwards. HF is subject to
time varying differential phase delays (and selective fading) which make
baud rate = bit rate systems almost impossible at much over teleprinter
speeds, except, possibly, for line of site paths. If you look at
Clover, you will see that it actually frequency division multiplexes
several very narrow (quadrature phase shift if I remember correctly)
channels. Direct QPSK at microwave can work at megabits per second.

Basically there are well known techniques for reducing the bandwidth
of a modulated digital signal. These vary from simple quadrature
phase shift keying, which can be decoded without DSPs, to the complex
schemes used in V.34. However, using wide frequency splits is so
much easier a way of obtaining full duplex than attempting to send
and recieve without any effective frequency separation, and uses no
more bandwidth in total.

You want to treat this as a learning exercise, to give you a real feeling
for some of the issues, but now is the time to consolidate that by getting
and reading a text book on electronic communications theory.

Through my experience, I would say your fine either way... 12V and 13.8V have pretty much become interchangable without a problem. and if you have a tolerance of 1.8V, and there is no problem, then 15V should be no problem as well, after all, it's less of a difference than 12 and 13.8... As long as you're in the ballpark you should be ok. Just don't attempt 24V. :)

I would not suggest going much over 14 volts on a mobile rig. When I was 9X5PT,
I tried floating a charger on a car type battery to feed a FT101 (rated 13.8V, 20A)
My homebrew charger was RF sentitive, and was charging full blast all the time I
was transmitting. Both switching transistors failed, and I had to cut them out of
the circuit to get back on 220 V power. VE3BOZ had to ship me spares from
Canada.... Small print in the manual quoted a 14 volt MAXIMUM input voltage for
the rig. So I would get a BIG 15 volt zener and float it on that output, and use a
fast acting fuse in series, as well. If your supply has 220-110 volt input, you
could feed it 120 volt and switch it to 220 volt mode, also. Or else remove filter
capacitors etc. to get it to lower voltage output.

According to TI, the last production run for the TCM3105 in plastic DIL
format was November 1995, and the last for SMD types was April 1996.
They have *no* plans for any more runs, it is officially a deleted part.

An excellent part for your application is the Lamda LAS 15CB
three terminal regulator, which is designed to put out 13.8
volts at 1.5 amps. It has a TO-3 package and a power
dissipation of 15 watts @ 87.5C.

'Fraid so. The core of a modulation transformer is designed to carry the
DC current to the PA, which an ordinary AF output transformer isn't.

I guess it could work, but you'd need to under-run the transformer very
considerably from its normal audio rating, to avoid core saturation.
Using an AF transformer with a higher power rating would also help with
any possible insulation problems.

Agreed. I've been wondering... How close to dead-on is a car's
13.8? I bet at low rpm, it gets a bit low... How about on the high
side? Does it ever get up to 15vdc?

I'll have to plug my dmm into the cig lighter and watch it on a few
trips to see what happens.

========== comments GM0CSZ / KN6WH
Garry, Two points :
1) If you wish to drop 24-13.8=11.2 V across a voltage regulator
possibly with series regulating transistors in parallel with the
voltage regulator, please ensure that these devices can dissipate the heat.
If your radio on transmit would need for example 9 Amps ,the devices
would have to dissipate a total of 9*11.2=100 Watts.

2) If you use a 12 Volts regulator (assuming its output is positive
in respect of the common pin) , put 3 low current silicon diodes in
series with common pin (forward bias) . This results in the output
voltage being increased with 3*0.6V=1.8V to 13.8 Volts.

Good Luck with your 13.8 Volts PSU.

I expect that would work. You can even use a reversed filament
transformer as a modulation transformer (though the high frequency
response often isn't too good). The big thing to watch out for
when trying to use transformers designed for other purposes as
modulation transformers is to make sure the insulation between
the windings and the core can stand the high voltage of the PA.
A flashover in a modulation transformer can ruin your whole day.

>reception is still terrible. He recieves all the stations at once. I
>saw the message thread on the razor blade radio, and we are going to
>give it a try.

The only selectivity a classic crystal set has is the loaded resonance of
the antenna. To improve selectivity, you have to improve the Q of the
antenna. About all you can do is use a resonant length (halfwave),
and mount it high and in the clear to minimize losses. That'll give
you the best Q with the most signal. The coil in a crystal set is
a loading coil for the antenna which allows you to resonate it at
various frequencies by adjusting the sliding tap. But as with any
coil loaded antenna, losses are least when the coil is smallest and
the antenna is closest to natural resonant length.

If signals are strong, you can change to a loose coupler circuit
to gain selectivity. In this case you add a capacitor in parallel
with the coil to form a resonant tank at the frequency of interest
and loosely link couple the antenna to the tank. This will, of course,
knock signal levels way down, but selectivity will be much better.
That's because loading on the antenna and tank are less, due to the
loose link coupling, so the loaded Q is higher.

If signals are *really* strong, you can use two tank circuits,
with loose coupling between them, to improve selectivity even more.
When you get to three or more coupled tanks, selectivity starts to
become reasonable, but signal levels become very small due to the
loose coupling. So you want to add amplifier stages between the
tuned circuits. Now you have a TRF receiver (another old classic),
but of course now you need to power it.

Don`t listen to those guys. Obviously, they have never tried it. Get yourself a
good Cobra 148 or Uniden Grant XL. These are easy to modify for 10M, just
change the xtal and re-tune the vco, mixer and RF coils. The Cobra 148 and
Grant have Excellent double - conversion recievers. Like I said, don`t listen
to the know-nothings.

Source record: 104066

Hi Rudi,
You might try to find a old CB tube amp and wind a new tank coil.
I have done this and works very well. You need to make a tank coil
about 1/2 the size of the 11 meter coil. Try to find one using a
pair of 6LQ6 tubes, it will have a output of 150 watts on 6 meters.
Cut the turns down in half.

If you can't find a schematic fo one let me know and I will send
you some that I have. Some of the CB 200 watt maps have 6 meters on
them.

4389. crystal radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-14 00:00:00 UTC
From: Shimon Hirschhorn <shimon@pos.co.il>
Message-ID: <31E9841B.203B@pos.co.il>
Source record: 104070

Hello,

A couple of weeks ago I bought my eight year old a crystal radio kit. He loved building it. The problem is the reception is terrible. I fixed him up a ground plug that plugs in to the ground of the electric socket, and a antenna that attaches into the cable radio antenea. The reception is still terrible. He recieves all the stations at once. I saw the message thread on the razor blade radio, and we are going to give it a try.

Does anyone know of a decent kit for a crystal radio, or possibly easy plans that I could buy the parts for?

BTW, I once heard of a "Penny Radio" that used one US cent and some wire. THe plnas were supposedly in Mother Earth News about 10 years ago.

Thanks in Advance for any hints and help.

Shimon

Hello Garry:

Yes I would vote that 15 volts is a bit high for your radio.

There are voltage regulators that are adjustable in a TO-3 and TO-220 case, the TO-3 being preferable. I think the part number is LM323, its a 1.5 amp voltage regulator that can have its output voltage easly adjusted by a inexpensive 5K pot. Radio Shack has a short book on voltage regulators. And with 24 volts available it should had auto work. If you follow the pin out wiring corectley.

Or a regulated 12 volt power supply all ready assembled would save a lot of time, Radio Shack also has a low current unit available.

Hope you get ot all working.

Jay.

+-> Kenova, WV 25530-1511

Most of the other posters have suggested various ways to use a linear
regulator to produce the 13,8 volts you want. National Semiconductor
makes a very simple *switching* regulator called the LM2576. These
parts come in 3,3v., 5,0v., 12,0v., 15,0v., and adjustable versions.
You woule want either the LM2576-12 (fixed 12v version) or the
LM2576-ADJ (adjustable adjustable). They come in a TO-220 package,
and are almost as easy to use as a 3-terminal linear regulator and run
a heck of a lot cooler. They produce a positive output, and the
heatsink tab is ground. The data sheet includes full application
information, including where to get the inductors (3 suppliers).

4394. Anyone know Bill Welch(formely W1SAD)

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-15 00:00:00 UTC
From: JustMe <brastoo@earthlink.net>
Message-ID: <01bb7206.b0899f00$3a082599@brastoo>
Source record: 104075

I would like to thank Bill Welch, formely W1SAD, for his wonderful training back in 1956 at the El-RAY radio club of Ratheon in Waltham, Mass. Because of him I received my novice licence in 1956 (WN1IIO) and have had many wonderful years of fun ever since. That was back in the years when HAMS were HAMS and knew electronics and were not just appliance operators.

Last known, Bill was located in California.

Thanks.

Bob W4GBB

In article <1996Jul13.080226.26905@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us
says...
|
|You can raise the voltage of the common 12 volt three terminal
|regulators (7812, LM340, etc) by putting diodes in series with the
|common terminal to chassis (note that you have to use an insulated
|mounting for the tab, IE a mica washer). 3 diodes will increase the
|voltage by 1.8 volts (0.6 volts per diode drop).
|
|Note that the regulator will have to drop 10.2 volts to get from
|24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it
|very well. A TO-3 cased regulator might be a better choice (again
|use a mounting kit, you can't ground the case). The added diodes
|need to be rated for the current as well.
|
No, the current though the diodes is only 10mA or so, so any type diode
will do.

Peter

I would expect 0.3 db or so.
>
>Where do guys like SSB Electronics put the helicals in their
>helically filtered preamps ?

If you want to filter out signals causing intermod, you have the
filter first. If you want low system noise, you have the FET as
close as possible to the antenna (relay screwed onto the connector
with no co-ax, make the sex of the connectors so you have no
barrels etc). It that case you have the filter after the preamp.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

4401. Re: AM Modulating Tube Finals With Solid State Audio Amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-15 00:00:00 UTC
From: kferguson@aquilagroup.com
Message-ID: <4sefsm$a5r@blixen.aquilagroup.com>
Source record: 104082

Idea:

Run a fairly high DC current through the low impedance side of transformer to cancel the flux due to plate current through high impedance side. The DC plate current on "true AM" final (as apposed to DX-60 type controlled carrier stuff) is constant.

The advantage here is that the required impedance of the audio choke would be lower, and the choke would be at low voltage, so insulation requirement is eased. Given a sufficiently high voltage, you could just use a high value resistor here, instead of a choke.

It doesn't have to be exact, youll get a little distortion as you bump against saturation one way or the other, but the other polarity should reset the core nicely. I guess music broadcasters would object, but I don't see losing the peak of one sine wave now and again as being much a detriment in a communications application.

If the transformer has a third winding, this could be used for the balance current, eliminating the need for coupling cap to audio amp.

If you use a DC coupled audio amp, then you could just put some DC bias on the amp's output...no choke!

Maybe you could encorporate low impedance side of transformer into collector circuit of a class A audio amp, thus eliminating need for seperate choke, coupling caps etc......getting rather an elegant approach at this point!

>Yes I would vote that 15 volts is a bit high for your radio.

Hi!

I ran some tests this afternoon with my DMM. I connected the DMM
to a lighter plug and then drove around and watched the voltage.

Here's what I saw:

Started out at 12.8v before starting the car

Started the car, and it jumped to 14.8 for several seconds then
settled down to 14.6 for about 2 minutes.

As I drove over the next 10 minutes, it slowly creeped down
to 14.2 where it stayed. (at least until I quit watching
the meter and started watching the road!)

FWIW, the car is a 92 Explorer.

> 534 Shannon Way | Guaranteed! | Email to ke4zv@radio.org
> Lawrenceville, GA 30244 | |

Gary,

I appreciate the help. I will try a simpler antenea. I want to avoid a powered set if I can. What my son finds so interesting about the set is that it works as if by magic. He can accept that a sophisticated electronic device can do almost anything. That a crystal set without even a battery works is amazing. BTW, most of my co-workers who are fairly educated sofware people are sure that I am lying about a non-powered radio.

I still would like to find a better kit if I can. I want to keep my sons interest in electronics up. Small projects that he can do with little help like a crystal set fit the bill. Not having it attached to the AC kepps my wife calm about the matter.

Thanks
Shimon

4407. Glue for base of tubes..

-jstroppe@uhl.uiowa.edu (John Stroppel) wrote:

-#>What do you guys use to glue the loose base of vacuum tubes back to the
-#>glass envelopes. Is epoxy glue alright?
-
-#>John WA0VYZ

I don't think that the muffler bandages will work because they need
pretty high temperature to set, 400+ degrees. Your tube won't get hot
enough. There is some stuff called JB-Weld that is an epoxy
made for high temperature use. You can find it at an automotive
supply store too. If you can't find that then regular RTV silicone
rubber works pretty good at the temperatures that you might find
at the glass of your tube. I think it is good to around 300 degrees.
Don't use the "quick set" epoxies, they won't stand the heat and
they can create quite an odor when heated.

Hi, need help with the above project.

I have got probs with the CPU board,.

The radio will tune up, but just keeps on tuning up when i tune down, using an incremental encoder.

The radio tunes up and down ok with the mic buttons.

Any help or tips from anyone who has built this project, would be very welcome......

I am posting this message on behalf of G7ELV... Peter..

I will pass on any replys to him....

Cheers from Len.... and G7ELV..Peter....

4409. Re: AR-1 Ramsey Kit question

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-15 00:00:00 UTC
From: Phil <pmetcalf@xyplex.com>
Message-ID: <4sdrlq$pt@cronkite.xyplex.com>
Source record: 104090

I have not built the AR-1 but I have built a few other Ramsey kits.
One thing to check. Make sure that L6 & L7 are moving. I had one kit where
the core worked out of the bobbin and no matter how much I turned it, it
would not adjust.

Another possibility is a wrong value capacitor in the tuning circuit, or a
bad (off frequency) crystal. If you built this from a kit, double check
all of your connections adn soldering. Check to see if you have any shorts
specifically around the tuning circuit.

Hope it helped!

: 'Fraid so. The core of a modulation transformer is designed to carry the
: DC current to the PA, which an ordinary AF output transformer isn't.

: I guess it could work, but you'd need to under-run the transformer very
: considerably from its normal audio rating, to avoid core saturation.
: Using an AF transformer with a higher power rating would also help with
: any possible insulation problems.

The way that old plate-modulated AM broadcast transmitters worked was to avoid running the DC through the modulation transformer; I imagine it helped a lot in achieving low distortion levels. You run the DC through a good audio choke, and couple the modulation transformer to the RF_PA end of the choke with a capacitor. This also removes DC from the transformer "secondary" so there would be less liklihood of any insulation problems, but there really weren't any anyway, since the transformer was designed to have the "secondary" (originally primary) driven by plate voltage plus audio anyway. Finding an appropriate choke (and capacitor) might be some fun. They were often the largest components in an AM broadcast transmitter, larger than the power transformer and filter caps and choke.

Solid state amplifiers typically don't care _very_ much (compared with tube amps) about what load impedance they see, so long as you don't exceed their current capability; but it would be fairly important to use a design that really could put out the power. Typical audio power in a hi-fi system is much below the peak power the amplifier is capable of, and you'd want to make sure the design (including things like heat sinking) was appropriate for the average and peak power you'd need for modulation.

4411. Cheap Rig for New Tech-Plus?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-15 00:00:00 UTC
From: Rick Miller <rick@DigalogSys.com>
Message-ID: <Pine.LNX.3.91.960715091613.2160A-100000@net.digalogsys.com>
Source record: 104092

Hi!

I finally got back into ham radio by getting my Tech-plus license this weekend! I was tired of kicking myself in the pants for letting the license I got when I was 12 years old expire. :-) With Navy morse training and an Electrical Engineering education, it was a *breeze*! I'll probably upgrade later this year, my testing being limited by the 4-year-old son I had along and the wife waiting impatiently for me to come home.

So here I am, a new Tech-plus without a rig. I'd like to build something simple (and *dirt* *cheap*) that I can operate until I can scrape up enough "mad-money" to buy a 2-meter handheld. CW-only is *fine*. I even still have the straight key I got when I was twelve, in good condition too.

Does anyone have any suggestions where I might find easy-n-cheap plans or kits? I just want to be able to get on the air *somehow* until my hobby fund can afford something nicer.

(Any response from anyone familiar with Milwaukee-area repeaters would be *doubly* appreciated!)

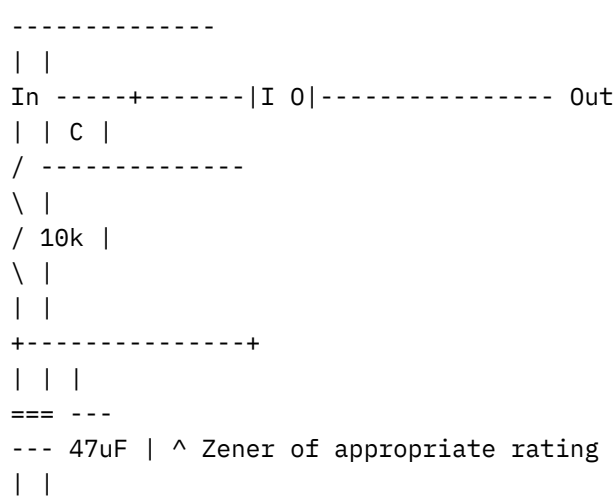
There's a gotcha related to this :

I once needed a 24V 2A supply for a tape streamer. Now, the local electronics shop only stocked the 78Sxx's up to the 78S15 (15V), so I decided to use that and put a 9.1V zener between the common pin of the regulator and ground, with a 10k (or thereabouts) resistor from the input to the top of the zener to ensure the zener was passing a sensible current.

It worked fine off-load, but when I powered it up with the streamer connected, the output was very low. Experimentation proved that connecting it to the streamer after powerup was OK, as was shorting out the zener and powering it up with the streamer connected. In the latter case, the regulator gave out 15V, of course, and upon removing the short across the zener, the output rose to 24V and stayed there.

I finally discovered that the switch-on current of the streamer was enough to cause the output pin of the regulator to be below 9V for a significant time after power-up. Thus, the output was more negative than the common pin, which caused the 78S15 to go into shutdown mode. I finally cured it by connecting a capacitor of a few 10's of uF across the zener to give a 'soft start'. It now works fine...



```

>Note that the regulator will have to drop 10.2 volts to get from
>24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it
>very well. A TO-3 cased regulator might be a better choice (again
>use a mounting kit, you can't ground the case). The added diodes
>need to be rated for the current as well.

If you're using diodes or zeners to 'jack up' a regulator, they only carry the (low) current needed by the regulator itself, not the load current. They don't need to be highly rated.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
July 21st, 1996
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Years ago (> 10+ years?) I read that it is quite possible to get
transient spikes up to 80-90 V. Modern vehicular electrical
system might do better. However, if you know that in some aspects
the specifications for vehicular electronics system is more
stringent that Mil Spec, you might get worried. Any one with some
facts to fill in?

Hi! I need to procure some B&W airwound coil stock for a project,
and was hoping that someone could recommend a supplier for such. I
haven't ordered it in years, and the last company I got some from
is no longer in business.

If it matters, I need a length (8" or so) of 3 in. dia. stock, 6 TPI.

Please drop me a note if you've acquired some recently.

4417. Need input on HF antenna idea

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-15 00:00:00 UTC
From: dkg@value.net
Message-ID: <4se2tc$av@vnetnews.value.net>
Source record: 104098

I am currently looking at a HF unit to add to my shack. The problem is, I am in an apartment, making it diffuclt to put up a low band antenna.

However, while out on my pouchh the other day I noticed the rain gutter comes down right at the edge of my pouch (I'm on the ground floor).

Anyway, here is my idea: Disconnected the raingutter from the ground, then load the gutter up through a matching transformer. Would this work? I'm also worried about how this RF energy would affect others. What if someone touchs it while transmitting (200 Watts)? I figured that there was atleast 1000 feet of aluminum rain gutter going around the building (very conservitive figure). Thus, with 200 Watts, there souldn't be that much RF at any one point that would harm anyone. Maybe only transmit at night? I'm also conserned on how it will affect other peoples TV and radio reception.

So, will this idea work? Any ideas, thoughts, or comments?

From: CHRIS@seitz.COM
Message-ID: <85EE722F012E0F00@seitz.com>
Source record: 104099

I have been collecting parts for an amplifier using a 4X150 on
6 meters. The plate supply is easy but I'm not too sure about the
grids. One supply is about 300 VDC at ~ 50 mA regulated and the
other is at aboth -75 VDC but I don't know the current draw. Is the
300 V supply right and what is the current level on the -75 V supply.

One of the things that I was looking at is that it would be
extremely easy for me to design a switching supply for the grid
supplies running off of say 12 VDC. This could lead to later
designing a 12 VDC to ~1500 VDC plate supply for portable operation.
My only problen is not being familiar with the requitements for these
supplies and old designs don't worry about it.

> Also look at the Aug. 1973 issue of "Radio Electronics."
> for some design data from Don Lancaster.
> -Larry

Here's a couple of comments to complement Larry's posting:

1) I have built Bob Roehrig's WWVB active antenna, receiver and frequency comparator, and they work just fine. Unlike Larry, I happen to be blessed (?) w/ being approx. 65 mi. from the WWVB transmitter site; I had to really reduce the receiver gain to comply w/ Bob R.'s alignment criteria. I guess I'll have to reduce the receiver gain further when the ERP of WWVB is increased...

2) Beware of local noise sources (esp. light dimmers) whilst receiving WWVB. During my initial bench test on the active antenna and receiver, just one activated dimmer in my house produced enough interference to render the received WWVB signal useless.

3) Don Lancaster's WWVB article in the August 1973 issue of Radio-Electronics (and the concluding article in the September 1973 issue) IMO provides an alternative WWVB receiver approach, but the designs presented may require some revision due to obsolete/unobtainable parts. Note also that Lancaster's articles were oriented towards reception of the WWVB serial time code vs. Roehrig's emphasis on frequency comparison (though both authors discuss ways to get both frequency and time code from their projects).

4) Another source of information (if you can find a copy) is the October 1964 issue of Hewlett Packard Journal. This issue has an article which discusses the venerable HP 117A VLF Comparator, which AFAIK was one of the first instruments designed to provide a relatively quick means of NBS/NIST-traceable frequency comparison via WWVB.

How about removing the resistor alltogether and using the regulator
bias current to (a few 10s of mA) to provide the drop across the zener.

A couple of 0.1uF capacitors between input and common and output and
common on the regulator to avoid instability.

I have used an LED for the zener, with a 12V regulator you get 13.9V and
an "ON" indicator.

Hello,

my name is Michael Martinsson. I'm currently doing a project for my university (I'm a student). I'm going to build a radiolink for data transfer. The data are going to be transfered from a mobile station about 500-1000 metres from the University. I think the best frequency for me to use is in the band 432-440 MHz. What I want is some ideas about the construction or some good books or links about this kind of construction. The University wants a proposal for one professional solution and an investigation about how to build it ourselves.

I hope someone can help me

Best Regards

// Michael

Some of the lower-current regulators don't provide enough bias current
to let the zener stabilise. I was caught by that once as well, and now
prefer to include a resistor if possible. The extra cost of the resistor
and soft-start capacitor is minimal, and it ensures that the design is
reliable.

>A couple of 0.1uF capacitors between input and common and output and
>common on the regulator to avoid instability.

Agreed. I did include them (well, 0.22uF actually), but I didn't put them
on the ASCII-art schematic as I though they were 'obvious'.

>I have used an LED for the zener, with a 12V regulator you get 13.9V and

I like that. I assume it must be a red LED to drop 1.8V

Kevin AstirCS "1U" KO0B (kferguson@aquilagroup.com) wrote:
: Idea:

Hey, some good ideas there!

: Run a fairly high DC current through the low impedance side of
: transformer to cancel the flux due to plate current through high
: impedance side. The DC plate current on "true AM" final (as apposed
: to DX-60 type controlled carrier stuff) is constant.

: The advantage here is that the required impedance of the audio choke
: would be lower, and the choke would be at low voltage, so insulation
: requirement is eased. Given a sufficiently high voltage, you could
: just use a high value resistor here, instead of a choke.

But beware of the power dissipation...more comments below...

: If the transformer has a third winding, this could be used for the
: balance current, eliminating the need for coupling cap to audio amp.

Yes, but don't drive it from a hard voltage source, because that will
short out the audio! It needs to be driven from a source with high
enough impedance at audio to not load the audio amp too much.

: If you use a DC coupled audio amp, then you could just put some DC
: bias on the amp's output...no choke!

Good idea, but beware of power dissipation in the audio amp! If the
PA is running 1000 volts at 200mA, you need 100 watts of audio to
modulate it, at 5000 ohms. If your transformer has a 25:1 turns ratio, the
primary side will be 8 ohms, BUT you will need 200mA*25= 5 amps of DC at
the primary side to cancel out the secondary current. If the primary DC
resistance (just a guess) is a couple ohms, that's 10 volts DC drop in the
winding, but the amplifier will be running on perhaps +/- 50 or 60 volt
supplies, and you'll be dropping the difference (40 or 50 volts) in an
output transistor, at 5 amps, or LOTSA WATTS that you're gonna have to
dissipate in a heatsink. This might be a really good place for a class D
amplifier!!

: Maybe you could encorporate low impedance side of transformer into
: collector circuit of a class A audio amp, thus eliminating need for
: seperate choke, coupling caps etc......getting rather an elegant
: approach at this point!

Another idea is to use just the primary of a center-tapped tube amp output
transformer. Feed the PA power to the center tap. PA connects to one side
and the audio amp to the other side. The audio amp could be a high-voltage

power mosfet, or a tube...

>the AC kepps my wife calm about the matter.

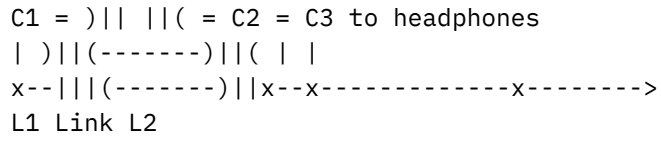
Ok, here's a classic loose coupled design. The coil can be an old
loopstick out of a discarded AM radio, and the variable capacitor
can be from a discarded AM set as well.

```
___
Ant \|/
| 1N34
| -----x------->|----x---------->
| || ( | |
| || ( = 365pf var = .1 uf to high impedance headphones
| || ( | |
Link-> ) || (----x-------------x---------->
|
_|_
Gnd ///
```

The link should be a couple of turns around one end of the loopstick.
You can vary the number of turns on the link and the position of the
turns on the coil to vary coupling, and hence selectivity.

Now if you add a second tank like this

```
ANT GND
| | D1
---)||( | ||(--x------->|----x-------->
| )||(--x ||( | |
```



Now you have one tank, L1, C1, which has the antenna link coupled to it as before, but now that tank also has a link coupled to a second tank, L2, C2, which you also resonate. By varying the number and positions of the turns on the antenna link, the first tank link, and the second tank link, you can make tradeoffs between sensitivity and selectivity. D1 is your "crystal". That can be an actual crystal, or a germanium diode like a 1N34. C3 is a RF bypass capacitor to close the circuit, anything from .001 to .1 uf should work.

Now if you insert a transistor RF amplifier in the link, you'll have a TRF receiver. A simple amp powered by a battery will work fine. This may be needed if signal levels are too low at the headphones. You can also add a battery powered audio amp and drive a loudspeaker instead of headphones. These would be the obvious next steps after building the crystal set. You don't need to fool with AC power.

(Note there are better ways than the TRF if you decide to go with amplification. The real next obvious step would be to build a regenerative receiver. I won't even attempt to draw that with ASCII art, but it can be done with only 2 transistors.)

Note that a good way to build these circuits is breadboard fashion. Use a real breadboard (a pine plank). Draw the circuit on the plank, drive brass brads at each connection point, and install and wire the components to these brads.

>300 V supply right and what is the current level on the -75 V supply.

300 volts sounds about right for the screen grid supply, but 50 mA
sounds high for screen current. The -75 volt supply is the control
grid bias supply. It shouldn't need to supply any current at all
to the tube, but it needs to be adjustable so you can set the idling
current of the amplifier. -75 volts sounds close to, if not beyond,
cutoff for the tube, so you'll want to be able to reduce this bias
voltage to set idling current. (I have a suspicion that the circuit
you have is for a Class C amp. You probably want a Class AB1 amp
instead.)

Note that screen supplies aren't simple. It needs to hold regulation
with either positive or negative current flow. There may be a shunt
resistor in the circuit used for this, and that would explain the
50 mA rating of the supply. And the screen needs to be bypassed well
for RF. You also want the control circuits to apply HV before screen
voltage, and remove screen voltage before removing HV, or you could
destroy the grid as it tries to become the tube plate. (This can be
done at the same time if you can ensure that screen voltage will
never be present without HV being present.)

Get a copy of Eimac's "The Care and Feeding of Power Grid Tubes" and
read up on what you need to do to make these amps live. You can use
switching supplies, but be careful to shield and filter them well.
If RF gets into them, they can go wild and destroy themselves, or
the tube.

>current. They don't need to be highly rated.

Yeah, that's right. For some reason I was thinking the regulator
was a shunt regulator. It isn't, of course. It's a series pass
design. So the main current goes from input to output, and very
little flows through the reference pin, probably only a couple
of mils.

I've thought of another thing too. Most of the TO-220 3 terminal
regulators can only handle 1 amp. This application needs more
current. A solution to that, at the cost of another 0.6 volt,
can be had by having the regulator drive the base of a series
pass transistor like a 2N3055. Then the regulator transistor
handles the heavy current and the 3 terminal regulator only has
to handle the output current divided by the beta of the 2N3055,
or about 50 times less. The downside is you lose the overcurrent
shutdown feature of the 3 terminal regulator when you do this.
In this application, a fast fuse should substitute nicely, but
another transistor could be added to starve base current to
the 2N3055 during overcurrent periods.

If you are interested in Crystal sets, I would recommend two sourses. First, Antique Electronic Supply, 6221 S. Maple Ave., Tempe AZ. 85283 Phone 800-706-6789 SThey have all the old fashioned parts like cats whiskers and crystal holders and both broadcast and shortwave crystal kits. Second, The Xtal Set Society,P.O. Box 3026, St. Louis MO. 63130 or Phone 314-725-1172. They have a regular newsletter from other crystal builders on how to articles. They also sell a number of How-To Books on building sets from scratch. Hope this helps. I use an old 1921 Steinite Labs Crystal set I got from my Dad.

If no one has one from a trashed SB100, you can copy the oscillator
section of the schematic and send it to International Crystal in
Oklahoma and they will make you one. Probably cost about $12.00.

Good Luck

Aim for much closer to 2000V, because you'll soon want to replace that
4X150 with a 4CX250.

>My only problen is not being familiar with the requitements for these
>supplies and old designs don't worry about it.

The requirements for modern Class AB1 operation are very different from
those for Class C.

This isn't meant to be an advertisement, but The VHF/UHF DX Book
contains about 75 pages more than I can say on the subject here!
It's now available from ARRL.

Also check out PA0ZN's ftp site (via http://www.nitehawk.com/rasmit/)
for details of a fairly simple screen regulator and trip circuit which
is now out on 'beta-test'.

ARRL lawyer to sue member

The following is a copy of a message I received today from
ARRL General Counsel Christopher D. Imlay N3AKD:

To: James S. Kaplan, KG7FU
Copies: Mary Lou Brown, NM7N
Terry Baun
John Poray
Date: July 16, 1996
Re: Your article, SBE Chapter 124 Newsletter, July, 1996
****

Jim, I have just finished reading your article in the July,
1996 Water Cooled Newsletter, page 6. In it, you argue that two of
my clients, the American Radio Relay League, Inc. and the Society
of Broadcast Engineers, Inc. should cooperate in certain government
relations projects, specifically spectrum protection. You note that
I serve as the General Counsel for both organizations. You then
jump from that argument to the following, which I quote:

If Mr. Imlay can't resolve HIS OWN conflicts of interest,
perhaps both ARRL and SBE should be seeking more
effective counsel. No offense Chris, but we have work to
do. We should not only be sending a message to the FCC
and Congress, but to other radio industries.

(emphasis in original)

It is not useful for me to educate you on the subject of your
article to correct the errors in it, and I do not intend to do so.
What I do intend, however, is for you to print a retraction, in
unambiguous terms, in a form acceptable to me, and to furnish to
me, in writing, an assurance that such will be printed in the next
Chapter Newsletter for Chapter 124. Failing that, I am going to sue
you in the District of Columbia for libel.

I have no intention of allowing you to falsely allege that I
have a conflict of interest in representing two of my best clients,
especially in an SBE publication. You are not entitled to damage my
reputation as a lawyer, which you have done in your article, or to
infer (without any basis at all) that I have violated the canons of
ethics governing attorneys, by which I govern my actions.

I will await your response.

Chris Imlay, N3AKD

And here is my reply:

Dear Mr. Imlay:

Thank you for reading my column in the SBE Chapter 124 Newsletter "Water Cooled".

I will not be giving you a retraction for any of my statements published in the July 1996 issue as you have requested. My statements are my personal opinions and views. I do apologize if you feel you have been hurt or damaged by my statements. My intent is to spur thought and action, not to personally attack. If your actions require others to think or act, don't you think they have the right to be informed? I believe my statements to be true and have been given no reason to retract them. My statements, by the way, are my own and don't necessarily reflect the views or opinions of Chapter 124, it's officers or members.

I am a member in good standing of both groups and do many hours of unpaid work for the benefit of both groups and their members. I take personal offense at the threat of lawsuit by their counsel. It is unprofessional and you are certainly coming close to conflict with your fiduciary duty to both groups by proposing to sue a member. Perhaps it is you who owe me, and the Society of Broadcast Engineers and the American Radio Relay League an explanation for your actions and your lack of action in certain critical spectrum protection matters.

After much discussion with SBE and ARRL BOD persons and members I have decided that the best way to deal with this matter is to offer you the chance to refute my statements or rebut, in your own words, in my column for publication in the next issue. In other words, please give yourself the chance to "educate me on the subject of my article to correct the errors in it".

I know you'll also agree that, if you choose to pursue litigation, the proper forum for legal action would be an Oregon court as the column was written and published here.

Sincerely,

James S. Kaplan KG7FU
Member SBE

>the specifications for vehicular electronics system is more
>stringent that Mil Spec, you might get worried. Any one with some
>facts to fill in?

The vehicle power buss is very dirty. During starting, transients
of 300 volts are not uncommon. Any time an inductive load switches
on or off (a fan motor for example), there will be a nasty spike.
Any electronics used in a vehicle needs suppressors to protect it
from these spikes and surges. That's normally built into equipment
designed to operate in the auto environment. But if you build something
yourself to put in the car, make sure you use adequate suppression
and filtering.

It is also normal for the vehicle electrical buss to vary from as
low as 10.5 volts to as high as 14.8 volts during normal operation.
So use of regulation is highly recomended for equipment which won't
tolerate fairly wide voltage swings. Once the alternator has recharged
the battery from the starting drain, the voltage will normally stay
in the range of 13.8-14.2 volts on the vehicle buss. But during peak
charging, voltage will rise to 14.8 volts, and if you run equipment
with the engine off, the battery can go down to 10.5 volts as it
nears the point where it is so discharged that it won't start the
car. (You should never let a car battery discharge below 10.5 volts
or you'll shorten its life.)

A number of ham rigs get *real* squirrelly when the voltage drops
below 11 volts. You can get that at the rear terminals of the radio
even with the battery at full charge if you have significant resistance
in the wiring to the radio. 1.3 ohms will drop 1 volt for each ampere
of draw. With a radio requiring 10 amps, you could wind up with nearly
zero volts at the back of the equipment if the resistance of the total
wiring between the battery and the radio were only an ohm. You want
wiring that has a total resistance in the 1/100ths of an ohm range.
Use heavy cables and good connectors.

Source record: 104122

eGary:

About 30 years ago I built a "crystal set" that worked without an external antenna. What I did was wind the tuning coil around a wooden frame so that it was about 3 feet on a side. I seem to recall that the tuning capacitor was across the entire coil but the diode and headphone was tapped down to just a few turns. Enough energy was picked up by the loop (via the magnetic component of the RF field) to power the radio.

This was not terribly sensitive: I could hear WLS (50 KW about 25 miles away in Tinley Park, IL - a Chicago suburb) but it wasn't as loud as the locals. My "design" probably could have been optimized a lot.

The advantage of this is that it is directional and has no external antenna. You could wind the coil on the wall of a room, and if you were careful it would be real big but not too visible.

The disadvantage is obvious - the energy picked up is proportional to the area of the coil, assuming that the other parameters are adjusted right.

Bob Beeman K9PLH.

How about some details ?
I always thought it would be a real task since the VCO frequencies
are controlled by embedded One-Time-Programmable microcontrollers.
Full duplexing is also controlled by the micro.
Didn't you have to re-write some code and program a micro to replace
the original one which was likely a soldered in PLCC package
(a task in itself) ?

I did hear of some Hams that were part of a Cellular design team
who obviously had the knowledge and resources and did it.
I suspect the 'average ham' would otherwise find it unfeasible.

I'd be interested if someone knows of a particular model of cellphone
that is simplest to convert.

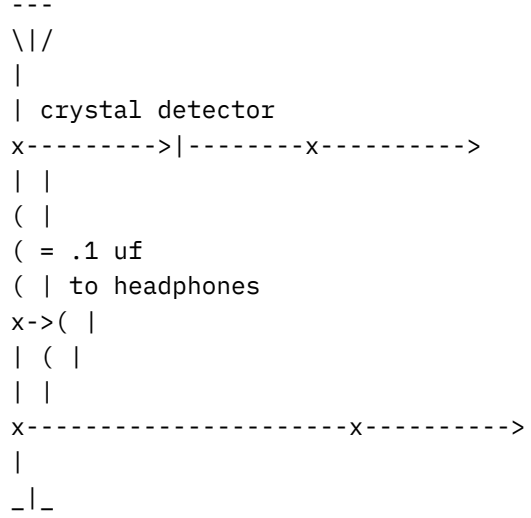
That's a good idea, Bob. A multiturn loop is a neat idea for combining
the antenna and coil into one component.

The "classic" crystal set doesn't have
a tunable tank, however. It looks like this



///

If the headphones are magnetic, the .1 uf capacitor is optional.

A tunable tank is a big step up in selectivity from the "classic"
crystal set shown above where the antenna is a self-resonant structure,
and represents the only selectivity in the circuit. Tapping *down*
on the loop for the detector and headphones also has the advantage of
matching to the lower impedance headphones we have today. The "classic"
circuit requires very high impedance headphones.

Yes Try Antique Electronic Supply, 6221 S. Maple Ave., Tempe, AZ 85283
Phone 602-820-5411. They have phones and all other parts to build crystal
radions the old fashioned way, along with good crystal kits. I do not work
for them. Hope this helps.

Charles

In the UK crystal earpieces are available from Maplin Electronics.
Alternatively, I have heard of people using low impedance phones with a
transistor amplifier output transformer to give the impedance
conversion.

I totally agree. The first wiper-delay I built and installed in my '74 Chevy Nova worked perfectly. The second, using the identical circuit, installed in an '80 Chevy Malibu was flaky as hell. Turned out that the windshield-wiper motor, when it shut off, was spiking the buss with a huge, negative-going pulse (it blanked my scope even on it's highest voltage setting, 100V I think.)

That was a low-draw circuit, just a 555 and relay, so I build a simple L-C low-pass filter to clean it up. Neither the L nor the C by itself was enough.

Now my question is, with a high draw device such as a transmitter, is there a simple, passive filter that will accomplish the goal? Seems like the series inductor would have to use some pretty hefty gauge wire.

Ahhh Rob.....
Repeaters in VHF High band are NOT that easy to get licensed or
coordinated in the major metro areas...The channels are crowded and hard
to come by nowadays....
If you havent gotten a license for the system, I wouldnt bother looking
for gear....you'll have plenty of time for that!
(Besides there is plenty of GE MSTR II, etc on the market that works
just fine! Rptrs, bases, mobiles converted to rptrs, etc)

4458. CW Crystal Filters & AGC Chips

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-17 00:00:00 UTC
From: sutin@helios.ucolick.org
Message-ID: <4sjidp$2ud@darkstar.ucsc.edu>
Source record: 103990

I intend to homebrew a 50 MHz CW tranceiver out of block parts, and
then upgrade the pieces as I go. The parts I can't find easily are
the filters and the AGC circuit.

I am looking for a small-quantity supplier for CW (500 Hz) crystal
filters, preferably near 25-30 MHz, but 8-10 MHz or elsewhere is ok.
I will design around what I can find.

I am also looking for an AGC chip -- a chip with the IF amp and an
audio input, which does all of the AGC computations internally. I
don't know if these exist (perhaps as part of a larger circuit).

Thanks!

There are some spot frequencies available in that band for low power devices in the UK and probably Sweeden as well. There is also a band at 418 MHz. You can buy ready made type approved transmitters and receivers. You CAN NOT build your own non-approved equipment for these allocations. The available radios are quite cheap in the UK, 20 pounds or so, in Sweedish terms, say the same as 6 large beers.

Mike

We have a web site for the hamfest....see below

http://home.aol.com/doug03

Well.... if you get this and still need more info let me know.

Don't forget the FIFTH ANNUAL USF "Last Minute" HAMFEST
Sat July 27th 9am to 3pm
in the ice cold air conditioning...

Hosted by the University of South Florida Radio and Electronics Club.

Admission $3.75
1st swap table $10 including ticket. Additional tables $10 each.
Call 1st for table reservations.
Call especially if you need more than 7 tables.
---
call (813) 979-0033 after 5pm

USF is easily located on Fletcher Ave between I-75 and I-275 in Tampa.
Enter campus on North Palm Dr. follow the signs to the
USF Special Events Center.

Just close enough to Busch Gardens to let the family go there while you play!

TESTING WILL TAKE PLACE AT 11AM.

TALK IN 147.24+, 146.94-,and 442.275+
Vendors may setup FRI NIGHT 6-9pm and SAT MORN 8-9am.

SEE YOU THERE!!!!

for more info, direct questions to: douglass@eng.usf.edu
See our web page for more information and maps.

One cheap/easy way to get close is using a TO-220 7815 (15 volts) to
run 2N3055 pass transistors. You get 14.1 to 14.2 volts. Pass transistors
can be run in parallel for more current. Don't forget emitter resistors.
Check the ARRL handbook 28-volt regulator article for an example of
running a bunch of 2N3055's off an IC regulator.

I use a 7815 and 8 2N3055's in a homebrew supply, and it's worked well.

[Article crossposted from
rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.equipment]
[Author was Christopher E. Brown]
[Posted on Wed, 17 Jul 1996 20:21:58 GMT]

Greetings all, I am looking for info on the construction of phasing coils (pitch/spacing/form dia/wire gauge/etc...) for 6m and up antennas (or down, though I am assuming the wavelength vs. material size would effect things on HF).

Also info on the pros/cons of using phasing coils or shorted stub delays. Does the better element spacing of the coil offset the radation from the coil, or is a shorted stub (at 90deg to the elements) better. How much does the position of the stub (at 90deg or folded against the element) effect antenna pattern?

All assumtions are made for 2 - 4 element VHF/UHF verticals.

The earpiece from an old telephone handset works pretty good. You know,
the old standard Western Electric model from the 50's 60's and 70's.

One from an old rotary dial phone would be perfect.

Hi All,

In article <4sefsm$a5r@blixen.aquilagroup.com>, kferguson@aquilagroup.com
(Kevin AstirCS "1U" KO0B) writes:

>Idea:
>
>Run a fairly high DC current through the low impedance side of
>transformer to cancel the flux due to plate current through high
>impedance side. The DC plate current on "true AM" final (as apposed
>to DX-60 type controlled carrier stuff) is constant.

While the average dc current is close to the same value, and the opposing
flux would likely work, it would also increase transformer heating from
I^2 R losses. The heat may cause additional problems.

>The advantage here is that the required impedance of the audio choke
>would be lower, and the choke would be at low voltage, so insulation
>requirement is eased. Given a sufficiently high voltage, you could
>just use a high value resistor here, instead of a choke.

Dissipation problems would oppose any advantage. The low impedance
transformer winding would require very high current. The series resistance
would now be critical, instead of series impedance.

>It doesn't have to be exact, youll get a little distortion as you bump
>against saturation one way or the other, but the other polarity should
>reset the core nicely. I guess music broadcasters would object, but I
>don't see losing the peak of one sine wave now and again as being much
>a detriment in a communications application.

I do. People operate up and down the band from each other. Every time the
transformer saturated, distortion products would modulate the PA. Splatter
would be produced.

>If the transformer has a third winding, this could be used for the
>balance current, eliminating the need for coupling cap to audio amp.
>
>If you use a DC coupled audio amp, then you could just put some DC
>bias on the amp's output...no choke!

And watch the audio output transistors dissipation and distortion increase
dramatically!

>Maybe you could encorporate low impedance side of transformer into
>collector circuit of a class A audio amp, thus eliminating need for
>seperate choke, coupling caps etc......getting rather an elegant

>approach at this point!

The problem with this approach is power dissipation in the class A amplifier.

This is a novel approach, it shows creativity. Unfortunately it trades insulation problems off for heat problems.

IMHO, ANYONE using a spacewasting mode like AM should pay attention to distortion and frequency response problems. The stuff is bad enough, without paying strict attention to bandwidth..

>
>I said no such thing. The comparison referred to mobile whips.
>
>>I explained Q as the fellow requested (not its repercussions etc...)
>
>It needed clarification.

Hi All,

Q can not be directly related to efficiency, in a mobile antenna or otherwise.

Q is the ratio of resistance to reactance in the antenna, but the resistance can be either radiation resistance (good) or loss resistance (bad).

Let me give examples of a mobile antenna with high Q that is bad, and low Q that is good.

Bad antenna.

An eight foot tall antenna very thick on the bottom and thin at the top. It has a lot of capacitance across the coil (like the Hustler with it's enameled wire and pretty metal end caps on the coil), the coil is low in the structure, and there is no capacitance hat. Here's what happens.

1.) The stray C across the coil increases coil circulating currents and losses while decreasing the bandwidth.

2.) The low coil position results in a lowering of radiation resistance and efficiency.

3.) The lack of a hat means the coil has high reactance, and since Q is X/R in the series circuit, Q is higher than it would be with a hat.

A good antenna with low Q. An antenna with a 2 foot tall and 4 foot wide cage on the top and great effort to minimize stray C across the coil, and a reasonable sized mast that has low distributed capacitance.

1.) Stray C across the coil is minimal compared to the antenna's end capacitance. The coil handles necessary current only, losses are lower and

BW larger!

2.) Coil position isn't critical because the large end capacitance terminates the current. Radiation resistance is over twice as high as in the first antenna.

3.) The large end capacitance reduces the amount of inductance required, so BW is greater.

Let me give fixed antenna examples:

A 1/4 wave vertical antenna with a good radial system (low Q, good efficiency), and a 1/4 wave vertical with no radial system and an end loading coil with no hat (high Q, poor efficiency).

As you can see, it can go either way with any antenna. Q has no universally true relationship to efficiency.

>insulation problems off for heat problems.
....

Hi Tom.

I agree, 100%, that you have stated facts, but have a different
opinion of them:

Consider that heat problems give a fair amout of warning , and respond
to brute force attack (big 'sinks and fans), while insulation problems
occur suddenly, require significantly more finess to fix, and pose
immediate hazards to safety. You can put your finger on a part and
tell if it is running a bit too warm, but how to tell if you are only
50V shy of breakdown? Which one is a homebrewer better equiped to
deal with?

I am talking here only about the dissipation in audio amp. or current
limiting resistors. If _quadrupling_ the I2R losses in the
transformer exceeds it's ratings, then of course you are sunk....and
are back to an insulation problem when the varnish melts!

It always happens when you use something for an application other than
for which it was designed:

You end up complicating the rest of the system to make up for the
inadiquacys of the "shadetree special" component. Figuring out how
to make the end system cost less, or perform better is a big part of
homebrewing. Were this not true, nobody would have ever used sweep
tubes for finals, plumbing fittings for antennas, pole pigs for HV
supplies, or transformers for filter chokes. In each case, there is a
better component for the job, albeit with greater price, and lower
availability.

Due to noise from AF amplifier, don't you want some low pass AF
filtering on the high voltage side anyway? As long as you limit the
modulating voltage to the required bandwidth, you are not wasting
spectrum untill voice gets too distorted to understand, requiring
repeating of messages. Isn't splatter normally associated with
overmodulation, which isn't what happens when transformer saturates
(modulation drops to zero)...Is this really more frequent or more
bandwidth than a click from a mike switch?

Oh well, I see we agree on that antenna Q thread.

Good to have somebody to argue with, who grasps the subject well enough to be worth it!

I have read the above with interest.

It seems possible to poke the right numbers into the phone to get the
right frequencies, but how do you adjust the filters at the antenna end
to bring the sets out of the phone band and into the ham bend?

You just about wreck them extracting them and pulling them apart, and
then you have to trim the metallisation to pull the filters over to the
right frequencies.

Perhaps you can purchase replacement filters???

Jeff
What about trying a pulse width modulation system which is what the
commercial AM stations do nowadays.(so I understand) The audio is
converted to a digital signal of pulses (at say 100KHz) with width
proportional to the audio voltage. These drive a high voltage FET
switching the plate voltage. The FET is follwed by a suitable low
pass filter to get rid of the 100 KHz sidebands.
(I must admit I havent done this however)
I have a hankering to get on 80 metres AM...

Actually, I was worried about compilence with existing laws. I didn't
want to break any amateur packet laws, or have the FCC come knocking
down my door due to an illegal transmitter. :) I also don't want
to have to sensor everything that crosses the wire. As you and others
have pointed out, that pretty much eliminates me from the amateur band.

I have no intention of running an illegal setup, nor corrupting the
amateur bands.

I just asked in these newsgroup because, well, you don't find
many newsgroups on the internet called
alt.how.do.i.build.a.microwave.transmitter.for.t1.speed. :)
I'll be sticking to the legal to use bands.

Take care,

dougt@rsa.cirrus.COM (Doug Thomson) had some comments about
using a filament transformer backwards to modulate a 6146,
adding that "The frequency response is not very good".

Back when AM was popular, you'd see tricks in the ham magazines
on using power transformers as modulation transformers. At
least once, I saw the suggestion of using 400 cycle surplus
(from airplane military surplus) transformers for modulation
transformers, because their higher operating frequency was
better suited to modulation purposes. Besides, the 400 cycle
frequency made them less bulky, and there wasn't a lot of practical
use for the 400 cycle transformers, though they were cheap.

There probably are still alot of these old transformers lying
around as doorstops and whatever that would still work well
in this idea.

If not a spam, it is most definatly off-topic here, as it has nothing
to do with homebrew and is not technical in any way.

I dont know the 4X150 - its an old glass tube that wont take as much stick as a newer ceramic one. Hence this advice is based on 4CX250's, but I think its similar in principle. The simple and best answer is to suggest you get the data sheet for the tube you use. Eimac will send you one free of charge, even for an obsolete tube such as the 4X150. The voltages, for different classes will be on the this.

First, for class AB1, there should be no grid current, so the power supply does not to source or sink much at all. If your supply can source 1mA, it will be fine. If you run class C its a different matter. There you draw lots of grid current. The 4CX250 takes about 30mA in class C, if memory serves me right, but check the data sheet - that will tell you. The voltage of -75 sounds reasonable, but I have no idea if its right for a 4X150 - check the data sheet.

For class AB1, the grid voltage should be set to maintain a given standing current, which for a 4CX250B is 100 mA. Hence you should not aim to have a particular grid bias, but aim to alter the grid bias so the tube draws the correct amount of standing current. For class C, you must cut the tube off. I should add that I dont know if a 4X150 can be used in both classes AB1 and C.

For screen current, you have to be more careful. The screeen current goes both positive (ie draw current) and negative - ie the tube puts current into your power supply. If memory serves me right, the 4CX250B can source upto 20mA, so the power supply must be able to keep the voltage constant, even with this screen current. The tube can, under different circumstances, draw 20mA or so. Hence the PSU must be able to source or sink 20mA or so. The easiest way to do this (but not the best), is to use a zener supply capable of supplying 40mA, then put a resistor across it that draws 20mA. Now it can source or

sink 20mA. A better way is to use a decent screen power supply - there are many published.

HT's are not quite as easy as you suggest. Make sure for one that you fuse it correctly, and that your anode current meter is not in the + lead, at nearly 2kV above chassis. Have you limited the switch on surge to protect the caps and diodes? Have you a decent earth ?

John Nelson, GW4FRX has written much on the 4CX250's and 4CX350's in the VHF/UHF DX book. I suggest tyou look carefully at that.

There also may be some liability in publicly posting a private legal communication, I don't know. But I do know that spraying the net (8 newsgroups?) with your private gripe is kind of obnoxious and seems intended to intimidate your "opponent". If you wanted opinions from the group(s) about the original complaint, you should have discussed it with us legitimately. You may be a bit casual with your use of mass communication, and you may have also added to your difficulties by posting this way.

I need an assembly/operating manual for the Dick Smith 80 Meter xcvr kit.
This was sold in the US during the late 80's/early 90's in kit form only. I
have 3 of them assembled from a ham fest but only one receives, none transmit.
Would appreciate help in locating a manual. I will be glad to pay for copies,
postage and a service fee for your trouble.

Hello All,

I have the following list of hardline connectors for sale
All connectors are used but in good condition.

(1) of HCC-78-50NM for 7/8" air

(2) of HCC-78-50NF for 7/8" air

(2) of FLC-78- 50NF for7/8" foam

(3) of FLC-12-50NM for 1/2" foam

All 7/8" connectors are $20.00 and the 1/2" are $10.00

It is unfortunate that your initial exposure to Hams has been negative.
The fact is that you are dealing with people and some aren't so nice. I
was first licensed in 1952. It seems to me that Hams at that time were
more helpful, courteous and well mannered. Yes, there were isolated cases
of jerks on the air then. I have noticed, however, that the number of
jerks on the air have increased over the years. There is always the
option that you don't have to associate with them. There are plenty of
Hams with white hats left. Ham radio has several areas of interest other
than just communicating on the radio. My primary interest in the hobby
was and still is designing and building equipment. I do very little
operating. You need to sort out what area of the hobby interests you and
consider if it offers enough to put up with a few bad apples.

Regards,
W0MAY

4497. Has anyone modded a Rejunkcy RTE-202 to 900 mhz?

This won't work on amateur frequencies, as the transmissions comming
from the internet would most likely contain material from non-amateurs
and could also be made up of content unsuitable for transmission on
the amateur bands.

Message-ID: <199607191334.AA10521@rsa.rsa.cirrus.com>
Source record: 103894

I have done this using a filament power transformer run backwards. A 5.0 V secondary filament X-former with a 120 V pri, has a turns ratio of approx. 24 to 1. Now runing it backswards and feeding the output of a solid state amp @ 8 ohms gives an output impedance of 4.6 K (the square of the turns ratio times the pri impedance). A 6146 running at 750 v and 150 ma needs a 5K laod, pretty close. If the filament X-former is rated at 4A secondary, the pri current is 166 ma. Using a power x-former allows for load current to follow without saturating the core. The frequency response is not very good, the power x- former was designed to run at 60Hz, but I found that most x-former gave 2+ Khz top end, plenty good for AM, as a mater of fact the bandwidth need to be limited from the SS bandwidth of greater than 20 Khz.
Hope this helps. 73s

>Mark <KB9KHM>

As long as one could reasonably ensure the transmissions were compliant,
there should not be a problem. For example e-mail forwarding should
be OK(3rd party traffic, right?), but reading alt.sex.xxx newsgroups
containing profanity or business spams probably shouldn't be OK.

The only REAL Part 15 argument that could work against your link, would
be that it would be BYPASSING a viable commercial means of communications;
the telephone. However, if you kept a web page that was up 24hrs/day,
you can argue that it is not reasonable to keep a telephone link
operational 24hrs/day, and so you would not be bypassing a commercial
system.

However, why worry about amateur compliance anyway?
The 900mhz band is now available for public data communications use,
and would probably work for Nick's application.

As my boss always says "why re-invent the wheel?" Western Multiplex makes
a little SS unit for 2GHz called the Lynx. These are showing up on the
surplus market because for high reliablilty/quality most cell techs don't
like them (a matter of personal taste). I would think that picking up a
used pair of these would be cheaper and easier than building something
unless you're looking for the experience. These units don't require a
license for operation as they are covered under part 15. I've put up 40
mile hops with them (using 8 foot high performance dishes) so I would
think that a pair of homebrew yagi's would get the job done for you.

Don't worry from that standpoint (in so far as I am concerned). I am a
former 11 meter op who got out of that bad news almost 4 years ago. I
know the feeling when it comes to CB. Too many "bucket mouths" and not
enough common sense. The most unfortunate point of all this is that
the nitwits are generally the most vocal.

>ARRL General Counsel Christopher D. Imlay N3AKD:

It never fails to amaze me how the granting of an operating license
by the FCC is taken by some of our fellow hams.

Remember "Hatlo's, They'll Do It Every Time?"

Towit, the granting of a license absolves the grantee from any personal
responsibility for their actions.

Apparently a keyboard and access to usenet news works the same way these
days.

Jeff
Who shouldn't be amazed by anything these days....

If two whimsical comments by two individuals is sufficient to change
your mind about amateur radio as a hobby, I agree that you will
probably not be well suited to it. Perhaps take up something like
stamp collecting, where you won't need to learn how to interact with
other human beings, even [horror!] those who don't agree with you.

You would probably be better off buying one of the license free FCC part
15 data radio systems on the market. These operate in the 900 and 2.4GHz
bands. For the short range you are talking about, you would probably not
have any interference issues to worry about. This would free you of the
difficult task of building your own RF hardware, which is not trivial,
and the problems of dealing with the limmitations of data format and

content operating the system under Amateur Part 97 rules (assuming you were interested in operating legally).

Good Luck

Steve Muther WF6R

4515. Source of Ferrite Beads?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-19 00:00:00 UTC
From: fiz <fiz@lamar.colostate.edu>
Message-ID: <31F006C4.7BA0@lamar.colostate.edu>
Source record: 104029

Hi,

Can anyone recommend a place to get ferrite beads big enough to slip over
RG-58? They don't need to slip over the BNC connector, only the cable,
0.2" OD.

If you are operating under Part 15, you neither have to worry about bypassing
the telepone circuits or content. There is no FCC/PUC ruling regarding this,
if there were, a lot of wireless service providers (in licensed and
unlicensed spectrum) would be out of business.

hmmm... good question, I haven't looked as yet myself. I do know
that they've designed their own T1 modem for some surplus microwave
radio they had....

>I was hoping to avoid "off the shelf" solutions due to their high cost.
>Besides, it would be interesting to experiment with building equipment
>like this.

Wavelans cards are not that expensive and may do just the trick for
you. TAPR just placed a group order for the cards with somebody and
they had the price down to ~$200 per card...

>Oh, one more question. Do you have any idea how much this type of
>project would cost?
welll a PC on each end (if you dont have them already) ~$2000 or
less... 2 wavelan cards for $400 A good pair of yagi's for 900
Mhz... $300 unless you make them yourself! and good quality
hardline and some bnc adapters....?

So figure ~$3000 total... $1500 per node is about right

Jim, you wrote and published that Chris Imlay was providing less than
fully effective legal service to two of his clients on account of
conflict of interest. And you have repeated that allegation to the
Usenet world at large.

I believe that a defense of personal opinion is not available to you
in this matter. I believe that you will need sufficient proof for
your repeated allegations of professional malpractice to have Chris
at least sanctioned if not disbarred, or your defense will fail.

> I know you'll also agree that, if you choose to pursue litigation, the

There was an excellent article on this in 73 magazine within the last
month or two. If you are stuck on Motorola, use a Micor mobile. It's
by far the easiest to come by and convert.

You will also need a duplexer to keep your transmitter out of your
rcvr.

You can get as fancy as you want with the antenna, but keep it
vertical, as the natennas on the vehicles are vertical.

This is indeed a feasable project, and you will learn a ton!

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple carrier operated relay. You still need to provide a duplexer, antenna, & ID'er w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

Hving worked on cell equipment for several years, I wouldn't try it.
Anything is possible, but considering that you would have to
reprogram, as well as retune the phone, at the lowest levels, It would
be more trouble than it is worth.

I would suggest looking for older comercial 900 Mhz equipment. Even
the newer stuff can easily be converted from trunking operation to
conventional, and some of it is starting to appear on the surplus
market.

Wait a second ...

If a fellow is working for two sides of an issue at the same time there has to be no proof of conflict. You can not prosecute and defend. There needs to be no proof.

I can't hire an FCC lawyer to represent me should I be accused of a Part 97 rule violation. The FCC would see that, without proof, as a conflict of interest.

Now, is the ARRL seeing their lawyer as being in a conflict of interest? We've not heard from them. Maybe we should wait for their thoughts. I hope they comment as I don't want to make my judgement based on what has been presented here (and with the implications a lack of comment would have).

Expressing an opinion that someone in a membership organization is out of line is part of the democracy of the organization ... right? The legal threats which resulted were sad. I would have defended myself in a reply. Let's hope he was just too upset to see an alternative course. If not, he's doing a pretty poopy job (I'm a member! I'm a member!).

>Jeff Cook

I am only a gonnabe lawyer, so I'm not going to express any legal opinions
regarding this dispute. However, I am going to say that I don't care much
for a scenario where a lawyer threatens litigation against someone who airs
an opinion that the lawyer is acting improperly. The First Amendment was
written precisely to permit ordinary citizens to criticize powerful members of
society without fearing legal retribution. When an attorney seeks to exploit
his stronger position vis'a'vis his ability to litigate, in order to suppress
free speech, this is not good.

In fact, I suspect (this is not a legal opinion, just a guess) that a court would
make short work of any libel case connected with this matter.

As far as the use of the internet goes, I kind of think that the internet
strengthens free speech, by giving those without ordinary media access
a public forum in which to express opinions. Nothing wrong with that, in
my opinion.

Keep in mind that if your voice is somewhat low-pitched, a 400 Hz transformer may not present enough impedance to the output amplifier and will result in excessive current drain. Check it out with an audio oscillator at different frequencies and then design the bandpass of your audio amplifier to reject anything too low.

4555. How to reduce radio interference???

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-22 00:00:00 UTC
From: LMNC01A@prodigy.com
Message-ID: <4suuea$12ie@usenetp1.news.prodigy.com>
Source record: 103937

I just took an old Zenith 158 computer with an 8-bit passive backplane design and installed the interface cards from an old 8-bit expansion box. I used it to add slots to a system that had few available slots.

It works great except that I get radio interference which I believe is coming from the two huge unshielded cables that carry the 8-bit bus between the two computers.

I remember that Zenith's 8-bit H89/90 systems always had heavily shielded cables for their external disk drives. These cables were grounded to the case. I have many of these cables left, but none are wide enough.

I am looking for some suggestions on how to reduce the radio interference. I thought of, but have yet to try, wrapping the cables in foil and grounding the foil. I am hoping to find a better solution.

From: davek@medphys.ucl.ac.uk
Message-ID: <1996Jul22.094807.89397@ucl.ac.uk>
Source record: 103941

I'm designing a tube amplifier, with a strip-line above a groud plane. Unfortunately the tube sets a minimum distance above the line of 90 mm, so the effects of a top to the linear cant be ignored - or can they ?????? I want to see the effect on the impedance of the amplifier cover, and determine how far away it must be before I can ignore it. If I make it say 4x 90 mm, the anode section of the amplifier is the 450mm high, which with say 100mm for the cathode section, is 550 mm. This I find a bit unacceptable for size.

I wish to find the impedance of a transmission line consisting of an air-spaced line a height above a ground plane, but with another ground plane above it: ie.

> has to be no proof of conflict. You can not prosecute and defend. There
> needs to be no proof.

Not necessarily, it must depend on how many sides there are. The
question is not whether Chris is working for two sides of an issue
but whether it is for two *opposing* sides. Is there an issue for
which he represents two parties where the advancement of one of his
clients' will come from a disadvantage to the other? If so, then
this would be a conflict. What is that issue where this now obtains
for Chris Imlay, Steve? Is the SBE petitioning for 2m? Is the ARRL
going after the TV bands? Do the parties have conflicting positions
on responsibility for EMC?

> Expressing an opinion that someone in a membership organization is
> out of line is part of the democracy of the organization ... right?

The criticism was not about membership behavior but about the
behavior of a professional employee of two membership organizations
in that employee's professional capacity. Chris did not lose his
rights to defend his professional reputation by joining one or more
of the client organizations.

Well, not that I recommend RAMSEY products... but they have FM stereo transmitter kits starting as low as $34.95. You can reach them at 1-800-4HOBBYKITS (1-800-446-2295). Their recent catalog has a $2.00 price tag on it, but I recently got it for free (I didn't request it).

Many folks think they have good kits... my limited experience with them has not been so good. Maybe it depends on what your expectations are. They have other models (more $$$) and accessories, so you might want to get the catalog first and determine your needs, and if they offer what you are looking for.

>repeating of messages. Isn't splatter normally associated with
>overmodulation, which isn't what happens when transformer saturates
>(modulation drops to zero)...Is this really more frequent or more
>bandwidth than a click from a mike switch?

Anytime the waveshape has an abbrupt "bend" or change in direction there is high frequency energy content. Take for example a battery, switch and resistor. Close the switch and current suddenly rises (click) open the switch and it falls (click).

The shape and slope of the rise and fall determine the energy content of the resuting waveform.

By that truism, we know that any squaring or deviation from a sine function in the waveform of the modulating signal results in high frequencies, wich modulate the transmitter and make splatter. Splatter not only occurs from negative modulation peaks, it also occurs from ANY non-linearity in the modulation system.

For example, if a PA has insufficient grid drive or if the screen is not allowed to follow the anode at the proper rate and level, it can produce splatter even with a clean modulator signal of less than 100% modulation level.

AM is probably the most complicated mode to do correctly. Modulation byproducts can bother people up and down the band even if you can't hear "distortion" on the desired frequency.

Haven't done it, but I've always thought it might make a good, cheap way to build a 100W linear for HF QRP rigs. 0.7V forward bias from a silicon rectifier applied to the bases of the final transistors, and a little feedback from collector to base to stabilize and to flatten the gain across the HF spectrum would probably do it. It might require adding a cap here and there if the transformer windings would short your bias to ground.

Good luck, let us know if you succeed!

>they use Radio (microwave I think) for line of sight LAN
>connections of up to 5 Miles.

This really leaves me wondering about the future of AX.25 ameteur packet
radio on 2m/220/440. Bandwidth restrictions in metropolitan areas pretty
much limit us to 9600bps. Other than keyboard-to-keyboard comm,
what's the point? This is way too slow to run TCP/IP and interface
with the Internet, so why not just go to 2Mbps ethernet bridges on 900Mhz,
and avoid all the amateur restrictions and politics?

Hmmmm, maybe I just answered my own question;
engrained-tightwad-ham politics will keep the amateurs running
at 1200bps - sheesh!

There is a two-part article starting in the July 1994 issue of
Electronics Now magazine, you could probably find it at most public
libraries. The article has schematics, parts lists, building and
adjusting instructions, and circut board layout plans for several
different transmitters and a reciever. There are plans for a 5-watt 3
channel audio/video transmitter, a 3/4 watt audio video transmitter, a
3/4 watt video only transmitter, and a reciever that will go directly to
a TV. The article also gives a company that sells kits.
I am in the process of building a 3/4 watt transmitter from the
plans and have had some problems finding a few transistors, but most of
the parts are readily available through mail order catalogs.
I hope any of this is helpfull

--hello
if you have a look in the circuit diagram you will see that the set is
powered from a bridge diode assy which gives 12 volts
a friend of mine just poked a couple of wires on the + and -
and fed it with 12 volts from the vehicle
i would suggest including a fuse and a 12v low drop out regulator
in series and possibly a reverse protection diode and a 14.6v zener
parralelled before the radio just for safety and a electrolytic
with a low inductance capacitor in parallel to reduce generator and
ignition noise

Brian Olliver G8DQQ May i appologies for being english but i didn't
have a choice

4579. How to detect WHICH PL tone receiving?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-22 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfDuyDp6.Htx@netcom.com>
Source record: 103961

I'm working on a simple remote base setup for my house, using 1.2 GHz FM as the access frequency. I thought of a simple way to control features of the remote base (mostly to be used to access HF) would be to transmit on different PL tones so that the remote base would detect the PL tone in use, and take different actions (frequency up/down, mode change, etc.) based on which tone is being received at a given moment. All of this is in lieu of DTMF tones.

So the question is: are there any published circuits (chip or circuit level) that would output a digital word (5-6 bits?) based on which PL tone is in the received signal at a given instant in time?

i your request you asked for plans to build a fm tx well heres how to
get both a tx and rx plans for free as well as lots of free data. goto
the motorola page on the www and order their book Analog/interface ics
device data vol.II(dl128/D rev5)on page 8-48 is the mc2833 ic it need
just a handfull of external parts for a vhf fm tx. and on page8-88 is
the mc 3363 ic this is a fm rx IC again few external parts and you in
business i built the tx on a 1.5" x 1.5" board powered by a 9volt
battery it works fine the tx power was +5dbm on mine. Motorola has some
great books for free for the asking !

Unfortunately FT-43-XX cores are just a little too small to fit ober
RG-58, so you'd need to get FT-50 cores. I think for RFI supression/
choking at HF, a -43 or -77 mix is what you want.

Dan's Small Parts has prices on Ferrite cores that are much better
than Amidon or Palomar. (FT-50-43 are 3/$1.25) Check out his catalog:
http://www.fix.net/dans.html

(I have no affiliation with Dan's Small Parts, except that I just
placed an order for some cores from him... We'll see if they arrive ok)

Does anyone know where I can purchase one of these ICs? I can't seem to find it from anywhere I normally order from.... (Either the Zilog or AMD version is fine...) Thanks.

Don asked about modifying this radio to 900 MHz. If it is the same model of business band radio that I have several of, it will be a difficult task if you keep the duplexor. I basically cannibalized one of them to see what makes it tick. It has a lot of nice parts that could be used to make a 900 MHz radio, though.

The best part is that I have a *complete* service manual for whatever model it is I have. The manual and radios are at home right now. I'll try to look tonight.

Hi,
I have 2 6KD6 sweep tubes. I purchased them for an amp and
found that they were physically too tall. I would gladly trade
for 2 6LF6 sweep tubes. They are identical except the lf's are
slightly shorter. Or I will sell them for $12.00 a piece.

4591. Might be FAQs: Wireless communication: anybody want to help me out ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-23 00:00:00 UTC
From: G.F.Vocking@kub.nl
Message-ID: <G.F.Vocking.39.31F4E339@kub.nl>
Source record: 103833

Hi there,

Sorry to post this question and bother you with what, I think, might be FAQs.

Fascinated with small electronics I would like to make some small devices.

For example I would like to make a communication set out of 2 headsets for full duplex conversation and a range of at least 10 mtrs. This is for use when training/racing on bicycles, so it should be small en light.

I'd also like to figure out how to make a wireless messaging system, which should be a little more complicated than the former project.

Any help will be appreciated. Including references to FAQ's on wireless communication, bugging and all other kinds of small communication devices.

Thanks in advance.

Regards,

Gustaaf

(inductor rated at or above the value of final plate current, and usually
around 50 Hys). No DC flows thru the secondary, only thru the reactor,
which can handle it. This method is called modified heising and has been
used in AM broadcast transmitters for years.

From: Scott Macmillan <scotty@golfmike>
Message-ID: <MngrZMACAB9xEwGO@golfmike>
Source record: 103836

Hello, and thanks for your time.
A radio friend of mine has just bought an Icom IC240,
2 meter FM transceiver with a super scan fitted.

The radio has developed a fault with the super scan.
It will scan OK, but when it stops on an active frequency
the channel displayed is not the one the stations are actually
operating on. I have went through every frequency on the radio
with the super scan off, and the channels are on the correct
frequency. i.e. S 20 = 145.500, S 22 = 145.550 etc.

Has anyone came across this fault before?

Does anyone have a schematic diagram for this radio, and
the super scan unit that the they would copy for him?
Costs for copying and mailing repaid of course.

Thanks in advance DE Scott - GM7OMU.

From: k5qq@aol.com
Message-ID: <4t2hhr$54g@newsbf02.news.aol.com>
Source record: 103837

Hi Bill

I have the cable and I think that is all ICOM is selling you for the $30. To run it on 12 VDC, you remove the "jumper" plug out of the back and plug the 12 VDC in there. I think the pin at the top of the triangle is the +12 in and the bottom is the ground.

When the set runs off of 110 volts, the power supply inside puts 12 volts on the 2nd pin and the jumper takes it up to the top pin.

Works great in my car, I just hate to take that much radio for a ride just sitting on the seat!!

1200 baud AFSK has one, and only one, thing going for it. It'll
work through just about any FM voice radio you can find without
any modifications. That lets Joe HT hook it up and get on the
air with it. So it allows quick assembly of ad hoc networks to
meet a limited need, such as shelter logistics communications
in an emergency. (It'll even work through unmodified voice
repeaters in many cases.)

Except for a couple of purpose made data radios, 9600 baud is
going to require modifications to a FM voice radio to work
(despite radio manufacturer advertising hype of "9600 baud
ready" included with virtually every new radio marketed,
which really only means they included a jack labeled "data"
on the back panel). Joe HT isn't going to do those modifications,
and anybody capable of doing them is also capable of going to
the next level. So I see 9600 baud over FM voice radios as a
dead end. (If the manufacturers ever *really* make their radios
"9600 baud ready", then that would be a different story.)

The next step up is raw FSK at 19.2 kb. That's pretty simple
for anyone who knows how to modify a radio to do, but there
are a number of practical drawbacks, most pointedly, the need
for wider receiver filters. The better next step is to abandon
the FM voice radio paradigm entirely and move up to a 56 kb RF
modem. That can be used on 219 MHz, 222 MHz, or 70 cm under
current FCC regulations. The technology is proven, and is now
off the shelf from PacComm. No kludged FM voice radio is needed.
(But an ordinary transverter is.)

56 kb is a respectable data rate. While we'd all like to have
our own personal T1, most of us settle for a 28.8 kb connection

to the internet, and a 56 kb link is a step up from that. And, 56 kb is *as fast as the FCC will let us run below 450 MHz*, so we can't do any better while still taking advantage of the better beyond line of sight propagation offered at VHF and low UHF compared to high UHF and microwave.

This latter factor is what kills any idea of fast microwave networks. Amateurs form a *sparse* network. We aren't located convienently to form line of sight webs. We often need the ability to extend links beyond line of sight in order to reach the next station in the network. Topology of terrain, availability of relay sites, and finances often won't let us do that with microwave relay. We aren't AT&T Long Lines. We don't have condemnation powers, and we certainly don't have the financial resources to set up relay chains like Long Lines used to maintain. We have to make do, and VHF/UHF links let us make do better for our amateur networks than microwaves can.

Note, while beyond line of sight isn't impossible to do at microwave, multipath plays hell with our modulations when we start to approach T1 in a beyond line of sight environment. This starts to get exotic for Billy Bob packeteer to deal with. And it virtually demands carefully surveyed fixed paths, which eliminates the possibility of setting up ad hoc emergency networks.

Except in a few special locations where either amateur packeteer density is very high, or special terrain makes high site relay practical for the mass of amateurs, we need the ability to warp our signals past the line of sight to make the next hop. We're not going to do that at 900 MHz or above at baud much above 56 kb, at least not in enough cases to offer a general solution. We need power to burn our signals past the line of sight, and we need a low enough baud and robust enough modulation to tolerate the multipath that non-line of sight paths will offer (though SS can offer a partial solution to that problem). Right now, that's easier to do at 220 or 440 MHz at 56 kb than at 900 MHz or above at T1. The bits we need are all off the shelf.

In those cases were the path will support it, microwave relay at high baud (T1 or greater), is a great thing. I support anyone who wants to work in that direction. But I don't think it is a general solution to increasing amateur packet network speed.

It is also worth remembering that our objective is *not* to duplicate the internet. We can just use the real internet for that. Amateur packet should exploit the unique mobility and flexibility offered by wireless networking in order to perform the tasks amateurs are best suited to do. That doesn't

include being a common carrier in most cases.

Our greatest strength is our ability to quickly assemble ad hoc networks to meet a specific (and perhaps fleeting) communications need. We need to build on that strength. We usually don't need huge bandwidth capabilities, though we want as much as we can practically get without interfering with our ability to quickly configure flexible networks.

I don't see 1200 baud AFSK going away any time soon on 2m. It is literally the lowest common denominator for quick ad hoc networks. It is virtually a no-brainer solution to simple data transport needs.

To go beyond that, we need plug and play hardware, and robust protocols that are to the maximum extent possible self-configuring and self-healing. We now have an off the shelf answer to the fastest permissible hardware for 70 cm and below. We have TCP/IP. But we don't yet have self-configuring and self-healing layers in the system, IE automated self-actualizing dynamic routing and network management software. (Netrom is the closest thing we have, and that's not good.)

I've harped on the need for this self-configuring and self-healing property as far back as 1986. I know of some work that has been done in this direction, but I don't know of anything that's actually been put in place out in the field. If someone wants a project, this is a good one, and one with applications beyond amateur radio. It shouldn't need a centralized source of control or a centralized database. This lack of dependence on vulnerable centralized sites is essential to our need to be able to configure and heal our ad hoc networks. It must be peer based as much as possible, but it mustn't consume all our limited network bandwidth in the process.

Anybody want the job?

Gary

No longer is it practical to do. Many years back you could make a
useable 30-50 watt cw rig from a tube type tv. These days it is so
impractical to do. Just by old novice gear or old heathkit gear and
go from there. If a person were poor enough to need to build ham gear
from a tv, I think they could still find donated ham gear in less
time than building from old consumer gear. Homebrew isn't cheap
anymore. I know, I built several receivers and power amps.

Just my opinion, 73 KD3SH

========== comments GM0CSZ / KN6WH
Erwin , May I suggest you get hold of a copy of 'The VHF/UHF DX Book'
published 1992 by DIR Publishing Ltd , ISBN 0 9520468 0 6
Editor is G3SEK who probably can advise on availability.
His e-mail address is : g3sek@ifwtech.demon.co.uk
It's a superb practical book for the home constructor. The chapter
you will be looking for : 'A high performance 50MHz transverter',by
Dave Powis,G4HUP.
Maybe the VERON Service Bureau can supply it. Good Luck with your
homebrew transverter.

I think we should file this whole thing in the trash, and label it
"too many lawyers." Let's see if I've got this straight:

A member of ARRL and SBE publishes a possibly defamatory comment regarding
a lawyer representing both the ARRL and SBE. The lawyer is also a member of
the ARRL and SBE. The lawyer threatens a defamation lawsuit against the person
who published the remark.

The lawyer was hired to represent both the interests of both groups and the
members of both groups. So he's suing somebody he's already been paid to represent
not once, but TWICE. This isn't just conflict of interest, this is absurd.
We don't need satirists to concoct tales like THIS when we have lawyers around.

I can't wait for this lawyer to get elected senator so he can name Congress,
the Supreme Court, the Judicial branch, and the electorate joint plaintiffs
in a defamation suit when they don't call him "Sir, Senator, SIR!" on the floor.

4604. Prototyping boards for SMD?

Newsgroup: rec.radio.amateur.homebrew

Source record: 103975

Many potentially useful new ICs are only available in SMD "SO" outlines based on a 0.05-inch pin pitch. How do you work with these ICs on ordinary 0.1-inch prototyping boards?

Has anybody seen such things as SMD to standard DIL adaptors for 8-pin and 16-pin SMD ICs? I'm thinking of something like a small PCB with tracks for 0.05-inch DIL SMDs, that would fan out to the standard 0.1-inch DIL pitch. Such adaptor boards could be either dropped onto a standard DIL header or wire-linked through to 0.1-inch tracks.

I suppose the other alternative would be to glue the SMD straight onto a 0.1-inch DIL header and wire it up by hand.

Are there any 0.1-inch prototyping stripboards like Veroboard/ Vectorboard but with some provisions for 0.05-inch SMDs?

And what about "SSO" devices using 0.025-inch pin spacing?

Ten-Tec sells such a converter kit. I bought one at Dayton for about
$10 US. It's just a 4cm square PCB - no case or connectors - so it can
easily be mounted inside the 28MHz IF radio.

There are, here in the USA, several different brands of small prototyping
boards which hold one or more standard SO devices and fan the leads out
for conventional wiring techniques. The brand name Serfboards comes to
mind. I think Digi-Key might sell them by mail. Seach for their WEB page.

I have had some success using deadbug techniques with SMT devices on
solid copper PCB scrap. I have even done microwave circuits using
zero lead length techniques with SMT devices on solid copper at
frequencies up to 6GHz.

It can be done, some of the tools to find for your shop which are
helpful are fine point soldering iron, stereo microscope and an
assortment of tweezers.

There are also the many different techniques of doing homebrew PCBs.

I'd be interested in others experiences as well.

The techniques of homebrew are definatly changing. As a microwave enthusiast, I wonder when someone will figure out practical ways to do die attach and microbonding at home!

---------snipped

> Gary Coffman KE4ZV

Gary ,Could you please educate me . Having read an article in QST on
'ready for 9600Baud'FM radios ,I understood that all the
Yaesu-Kenwood-Icom-etc VHF/UHF radios, ready for 9600Baud, had a
separate TNC output port which in fact inputs the TNC output directly
to the varactor circuit ,thus bypassing the '300-3000Hz conditioned
mike amp '. This is because the 9600Baud signal audio spectrum runs
from very low to approx 7200Hz.(?)
I can't imagine that the 9600Baud connection on some rigs is a fake,
although some rigs appear to have a lower Bit Error Rate (BER) than others.

In the lab at work, we have little PCBs available for single SMD devices
with the SMD pads brought out to larger pads around the edge. The SMDs
are soldered to these and the PCB wired up to the rest of the circuit on
the prototyping board using the larger pads. I don't think these PCBs
are available commercially, we get them made especially for our own use.

If you guys want to discuss lawyers and the ARRL, fine. Go for it.
But why does this discussion need to be in six different amateur news
groups ? Why not move it to one, maybe .policy, so those of us who
want to read it can, and those of us who don't want to don't have to
delete it six times every day when we download mail ?

Thanks,
Jim KH2D

(Yes, I know I posted this to all the newsgroups.....)

Allow me to second the suggestion of Surfboards. I bought a selection at Fry's Electronics (Sunnyvale) in the spring. Digi-Key (among others) carry them. They work well.

You can always etch a PC board into little square islands. This too works well.

If you have an old HP style pen plotter and a CAD or drawing package that can output to it, you can use a special ink pen (forget the part number; I have it at home) to draw a single sided board for mounting the SMD parts. I've gotten as good as .015" C-C spacing without ink bridging. Pullout your Radio Shack special FeCl etchant, Ammonium persulfate solution, or even old sulfuric acid and etch the board. For QFP's and other small C-C parts (or large pin count parts), it's real nice to pre-tin the board. I suggest using the various Stannous Chloride electroless flash solutions that are available (I remember G.C. (sic?) from Canada makes one; ~1 qt. for ~$10 several years ago). After tinning, flux the board. I use X-32 low residue flux; not rosin based fluxes. Use a small iron (such as a Oryx) and small diameter solder (flux core) on each pin.

: 73 de KB9JTT

This is true. Home-brewing a device to operate under Part 15 is not practical. Amateur radio is really the only practical way to home brew any type of radio transmitter, except extremely low power. If the application is illegal under the amateur radio rules then give up and find something else to do. There are many things in this world to experiment with. It's a bad idea to get fixated on one application (except, of course, VHF contesting) unless someone is paying you.

Excellent! I hadn't thought of this. I have a reasonably husky 2.5V
filament transformer on the shelf (those were for 866A rectifiers,
right?) which would give a 48:1 ratio, and if fed with a 4 ohm audio
power source (which most of the solid state amps deliver) would match
about 9K ohms in the plate circuit, which is doable with most of the
tubes I'd be willing to fool with. I guess the unanswered question is
whether a 2.5V filament transformer would clip the audio frequencies
even further; I'm not sure what the governing physics is in this case.
I would guess the audio response would be better but I'm not sure.
Any thoughts there?

Thanks for your response. I KNEW there'd be a use for that old 2.5V
transformer one of these days...

:Gary ,Could you please educate me . Having read an article in QST on
:'ready for 9600Baud'FM radios ,I understood that all the
:Yaesu-Kenwood-Icom-etc VHF/UHF radios, ready for 9600Baud, had a
:separate TNC output port which in fact inputs the TNC output directly
:to the varactor circuit ,thus bypassing the '300-3000Hz conditioned
:mike amp '. This is because the 9600Baud signal audio spectrum runs
:from very low to approx 7200Hz.(?)
:I can't imagine that the 9600Baud connection on some rigs is a fake,
:although some rigs appear to have a lower Bit Error Rate (BER) than others.
:Frank Dinger , Inver by Tain , Ross-shire - Scotland UK
:

Even with an input directly to the varactor circuit, there still is
a problem: the PLL. It doesn't do to much to the higher frequencies,
but the lower ones (e.g. below 300Hz) are filtered out by the PLL, trying
to keep the frequency "right". Only a modulator _outside_ the PLL loop
can give you a flat frequency response down to DC. (I admit, you don't
need DC, but the lower you get, the better.) In my opinion, the best
9600 radios are multi-mode rigs with a fixed-frequency modulator (no PLL!),
fed into a mixer.

>Any thoughts there?

Audio response is limited by core eddy currents causing a loss of permeability as frequency is raised, and by the winding method. Good audio transformers have the windings interleaved, so flux losses are reduced and coupling is improved.

Remember the power amplifier MUST be class C to be properly modulated, and if it's a tetrode the screen must also be tickled with a little audio. If it's a triode, the preceeding stage also may need to be modulated.

I am trying to build or obtain a device which can translate signals from from the 0-4Mhz band up by 100Mhz (which is in the FM broadcast band, 100-104Mhz). This will be used in conjuction with an FM broadcast receiver to demodulate FM signals which are in the 0-4Mhz range. I've heard that such devices exist, but am unable to locate one. Does anyone know who sells something like this or plans on how to make one?

Or could you perhaps "hack" a device which modulates video for RF on channel 3 or 4 (60-70Mhz). Does anyone know any details on how this could be done?

I tried hooking up an RF modulator to the baseband video output and
then tuned it with a TV-Band radio. Didn't have much luck with any FM2
stuff because the bandwidth of the radio was too great, but it did
work - I could tune the audio subcarriers quite easily.

Moe,

It would help if you would use a dictionary or spell checker
on your posts. (RE: ANTANNA for antenna, FREQUINCES for frequencies,
etc!).

Look in any ARRL Handbook for all the information you bave requested.
In there you will learn that each TV station has a picture carrier
which is amplitude modulated (AM). In addition there is a sound
carrier, which is frequency modulated (FM). Each channel occupies 6 MHz
of assigned channel bandwidth.

Well, its a week or so after I posted a question and the lack of
any answer makes me wonder if the fellow should get sued.

I ask my question again ...

Is there any rock solid evidence that the SBE and ARRL are opposed
to any particular issue? By "rock solid" I mean something like a
comment on a rulemaking from the SBE that would be contrary to an
ARRL position on the issue. Or maybe a SBE article that expounds
a position that is obviously anti-amateur radio.

Is the SBE for taking away 40 meters from the amateurs? Perhaps they
want two meters?

Anyone??? Something I can get a copy of ... a magazine article ...
something??? KG7FU???

A straightforward approach is to drive an RF port of a double-balanced mixer with a 100 MHz crystal oscillator. Feed the 0-4 MHz into the IF port through a low-pass filter (passing greater than 4 MHz but not too high). The receiver is connected to the other RF port.

Wrong. There's a hobby exclusion in part 15. (At least as of the
October 1991 copy I have on my desk.)

"15.23 Home-built devices.

(a) Equipment authorization is not required for devices that are
not marketed, are not constructed from a kit, and are built in
quantities of five or less for personal use." ...

And subparagraph b is about using "good engineering practice" where
the home builder is not able to test for full compliance.

it all depends on how you hold your toung moe, when you plug it up. And
as to where you insert the plug too. If you feed it a kilo watt your
neighbor should be able to hear you, if you run it horizontal at ground
level. as to the speed i dont know if i can improve much on the speed of
light... however if you run your thing a ma jig in a vacume you will
imporve the speed factor by a ratio of 1.12343765896 to 1 . with this
improvement your signal will be the first one to the receiving antenna
thereby allowing you first bid on the listners ear. hope this helps moe

>
> having stripped down a bunch of older cell phones, I would find one of the
older base stations that used vco's followed by doublers, (the 75.00
dollar unit carried by Timeline Inc,) or the older western Electric base transmitters
and replace the 425-440 Mhz vcos in them with minicircuits new $15.00
VCos at 450-470. And reprogram accordingly. I would strongly suggest just buying the
minicircuits VCO module for
for 900 Mhz and getting one of the 10.00 National Semiconductor Plattnum PLLs
from digikey (built in prescaler to 2.5 gigs) and add a low pass filter and a
interface to a PC port, then use a cheap 900 Mhz capable scanner to receive.

The cell phone base stations with the tunable filters might go up,
any thing new has ferrite circulator type filters that are going to block you, plus they
usually use
mixer down-converters or some other odd technology that just wont be to be pushed up,
unless you are lucky enough to have full schematics and access to the
software, as well as the one time programable chips. Its probably easier to roll your
own PLL using off the shelf parts, but strip the amplifier module out of the phone,
then derate its output power by 50% for use at 900, they usually work just fine,
once you figure out the dc bias level on the input pin to set the power level.
cell phones step their power in seven or eight steps by remote control
from the cell site, details can be found on the MHD type amplifiers on
Motorola's web site.

however another route might be to take your 440 rig, turn down the diviation,
hook it to a anttenuator and use it to drive a Minicircuits doubler module,
after reprograming the rig for out of band operation. This is how I finally got
900 Mhz operation, using a doubler out of the Western Electric base station and its Helical
Filters.

Hope this helps somebody, as I've tried 5 different cell phones with no luck.

Ok, don't want to be a flamer now...

I have seen several posts from You recently, and in none of them it was clear, what You exactly wanted (or it was written so generally, that it was impossible to answer). Try to use the following hints:
- before posting: Think *clearly* about, what You want to know, then post Your question.
- Using a spelling checker (or have a look in a dictionary, if You don't know, how to write a word) is not a shame. IMHO the spelling and grammatical errors You see in posts (from people with English as their native language) is unbelievable. If this is our future...
For me, English is a foreign language I had to learn pretty hard to get used to it. But I try to use it thoroughly.

Try to get some books about Amateur Radio. They are full of plans for any kind of Radio stuff. The ARRL (American Radio Relay League) ist a first class address for such books (http://www.arrl.org).
To use a transmitter (except assembled low power transmitters on some frequencies) You need a license (e.g. Amateur Radio). Transmitting on frequencies not covered by this licence is illegal and may be damned expensive, if You are caught.

Ok, take a breath, think about, what You want and then ask again.

Regards

Robert

Paul Anderson (pander01@harris.com) wrote:
(on helical reaonators)

: It is a high-Q device, with lots of rejection out of its passband. Not
: as high as a "cavity filter," but much smaller and much less expensive.

Just a little added food for thought on them...

The Q depends on the volume and frequency, and for usual (near-optimal)
designs using copper conductors, the unloaded Q is close to

Qu = 50*D*sqrt(f)

where
D is shield inside diameter in inches and f is freq in MHz.

So the tiny helical resonators used in handhelds aren't magically some
fantastic unloaded Q. You need significant volume to make a low-loss
narrow-band filter with them.

Another interesting point that helps remove some of the magic: the
unloaded Q predicted for a shielded inductor is less than the unloaded
Q of an unshielded inductor, generally. The unloaded Q of a helical
resonator is essentially identical to that of the same size shielded
inductor, per predictions of formulas in Howard Sams' "Reference Data
for Radio Engineers." In other words, there's nothing really magical
going on in a helical resonator that gets you some fantastically
increased Q. It simply becomes an appropriate choice for certain
available volumes and frequencies. (RDRE has a graph showing the
range of frequencies and Q's over which it's a most reasonable choice.)

HP sells some microwave devices (mixer diodes and mixer diode briges) in "beam lead" packages. I learned this from their microwave and communication devices catalog.) It seems from the specs that you can get very broadband performance from them. These packages seem to be just a tad bigger than the die itself with the added advantage of protecting the die from atmospheric corosion. The beam lead packages are typically just under a millimeter in their largest dimension. They suggest handling them with a toothpick wetted with isopropyl alcohol. They also mention a variety of ways of attaching them electrically in the catalog, the easiest of which seemed to be using some kind of electrically conductive epoxy. Although they can be soldered with a "wire" tip iron, or compression welded.

What's more, some of these devices are available from Newark in small quantities. Although I haven't tried to order any yet. But I am thinking of it. Seems easier than handing bare die directly.

This technique does work. I just used a bench signal generator,
and later I used an old International Crystal oscillator module
to drive the LO port of a Mini-Circuits SBL series mixer. The
signals from the satellite receiver are a bit high, so some attenuation
may be needed. I did not need any RF or IF amplifiers or filters
around the mixer.

The Bandwidth problem can be solved if you put narrower filters
in the IF of the FM receiver. These filters can be had from the
Toko section if the Digi-Key catalog if I remember correctly.
You can either make a narrow dedicated receiver or, as I did,
you can make sockets for the filters using 3 pins from a machined
IC socket.

Have Fun

Sometimes they are also called helical resonators.

Generally, one consists of a cavity (a metal can), a coil (inside the cavity, connected to it at one end, and unconnected at the other end), and a tuning screw (usually running down thru the coil). At the helical filter's resonant frequency, it's inductive reactance (inductance from the coil) will cancel it's capacitive reactance (capacitance between the coil and the tuning screw & cavity).

Often the filters are stacked together, with coupling via "windows" in the sides of the cavities. A signal can be put into the first stacked coil via a hardwired tap; likewise the signal can be tapped off of the last stacked coil.

It is a high-Q device, with lots of rejection out of its passband. Not as high as a "cavity filter," but much smaller and much less expensive. You will see a lot of them used as preselectors in receiver front-ends. If the tx/rx split is wide enough, they can also be used as filters in relatively inexpensive duplexers.

All you need is a 100 MHz Crystal and a multiplier. This is the principle of AM modulation

sin(a) sin (b) = ((cos (a-b) - cos(a+b))/2
so
sin(4) sin(100)= (cos(96) - cos(104))/2

This is the principle of the ADX converter, though it works in the 500 MHZ range.

I agree!!! My company has several of the LYNX at 2Ghz operating and are
doing great...one 12 mile hop and some are as much as 28 mile hops!
No problems with them at all!

BTW his idea would be perfect with the LYNX since he would run a straight
T1 connection and at the internet provider would be able to pump right
into their router (maybe without using a DSU!)..

Gee I wish I had that problem!

I am interested in making some projects for myself. Does anyone
have knowledge of what is available in the way of cheap tools,
ie: simulators, routers, placers, schematic capture, and pcb makers.

One project I want to do will require a lot of drilling, so I
really don't want to do this board myself at home.

> 73 TomThe high freqy response of the transformer is determined by the
interwinding capacitance. The leakage inductance also plays a big
factor. Several years back, Glass Audio magazine had a great reprint
article on transformer design amd construction. Check it out if you can
get a copy.

The screen can easily be modulated by deriving the screen voltage thu an
appropriate sized dropping resistor off the high side of the mod
transformer secondary to the screen.

In the UK and most of continental Europe, see Premier Farnell at
http://www.farnell.co.uk/components/compindex.html - you can ask
for their very comprehensive paper catalogue

In the US see http://www.marshall.com/ which seems to have a complete
catalogue on the net. There are others.

Paul:

I don't know how intent you are on rolling your own, but you might
want to check out the Wilderness Radio Sierra. It's a
commercialized version of the Norcal Sierra. It uses plug-in band
modules for 160M to 10M. I believe the basic kit costs around $200.00,
and band modules are about $25.00 apiece. (With appropriate quantity
price breaks.)

Disclaimer: I'm a member of Norcal, and spend entirely too much
money buying WIlderness products, but I don't get any money from
either of them. :-)

Recently, I purchased these adaptors from Mouser Electronics in Texas
USA. http://www.mouser.com Here are the names of a few US manufacturers
of such devices: ARIES Electronics. Mill-Max. I have seen other names
that I dont recall. Mouser carries both manufacturers. Good luck.

Sounds like he's trying to get one of the multiplexed audio
distributions off of a satellite. These are a bunch of FM subcarriers.
Like the audio on a analog satellite channel, only with the video being
replaced by more audio.

My suggestion is to just hack a stereo FM broadcast receiver so that its
LO is in the 10 to 15 MHz range. Strip out the front end tuning, and
replace the ceramic bandpass filters (if you need a narrower one), use
an RF signal generator for the LO. Look for a capacitor tuned one with
lots of room in the cabinet. (I've had plenty of fun with a Scott 515
that I bought for $35 many years ago at a used stereo store.)

Before they went the paths of either digitial or cheap, FM tuners built
10-20 years ago are very hackable. These days, most FM receivers are
really car audio units in bigger boxes, with the real guts stuck away in
some horrible little tuner module.

This rig cannot be modified to work on other frequencies. The PLL chip
is of the new type that generates the CB frequencies directly -
Changing the 10.240 MHz crystal wont work either - too many internal
chip functions depend on it.
See Lou Franklins "CB PLL DATA BOOK" available from most good
electronic book stores or CB CITY INTERNATIONAL PO Box 31500 Phoenix

: be done?

You can make a RF front end that preamps the 0 to 4 MHz and then mises it
with a 100 MHz oscillator. But the 0 end of the band will be too close
to the osc and the receiver will be desensed if it gets too close to the
100 MHz osc output.

You are forgetting about FM-Squared. That's a technology that puts narrowband FM audio subcarriers down in the 0-4 MHz range so that conventional receivers can't tune in the signals. Spacenet 3R has a couple of channels that use this method.

If you have a general-coverage radio receiver that has FM, hook it to the baseband output of your IRD with a 10 dB attenuator in line. You may be able to modify a TV sound IF board to tune in the 0-4 MHz range.

>You can make a RF front end that preamps the 0 to 4 MHz and then mises it

I'd forget about the heterodyne approach too. It would be easier to hack a FM module from a TV than to rig up a mixer. The FM-squared channels have a pretty substantial CARRIER signal at 0 MHz. That would be a bear to try to filter out without affecting the low end of the band.

First off, the signals are narrow or wideband FM modulated signals. The problem you might run into is that a FM receiver is wideband. But, when I tried the wideband signals were very good, and the narrow band signals might have some noise in them. You also need a receiver that has continues tuning, and not the wide digital step tuning of newer receivers.

You can build the whole converter using one chip, the NE 602. With only a few external components, you can upconvert the 0-5 MHz signal to 100-105 MHz. I can send you a copy of the schematic that I made, if anybody wants it. It is tested, and it works.

Playing with satellite TV, eh!.... ;^)

It's been a while since I have played with this stuff. :^)

Look into the Phillips NE602 LO/Mixer chip. Very simple and works
well.

http://www.semiconductors.philips.com/ps/acrobat/1144.pdf
http://www.semiconductors.philips.com/ps/acrobat/8065.pdf

Set the LC oscillator around 100MHz (or you can use a crystal).
That way, 6.8 MHz ends up at 106.8MHz, 4.75 is at 104.8, etc.

Be sure to use a high-pass filter. Don't let too much video get
into it!

For the very narrow-band signals, you may want to look into
converting the signals up to the 30MHz band using a scanner to
receive it. Any old cheap-o programmable would work. The
bandwidth is narrower and the channel steps are ideal.

If you are really into this, get a communications receiver
capable of SSB/CW. There are a lot more signals up there than the
FM ones on the video carriers! (didja' ever wonder why there are
so many "blank or gray" channels?). There are hundreds of
narrow-band SSB signals spread around on those "blank" channels.

Just stick the video output directly into the antenna jack of the receiver and tune from 100KHz to 10MHz with the BFO on (you may need to turn down the gain control or switch in the antenna attenuator).

A list of these signals is available at:

http://itre.ncsu.edu/misc/satchart

Some other links are available at:

http://itre.ncsu.edu/misc/sat.html

Good Luck!

Hello,
I am a high school student looking at the possiblity of designing and building a 20M SSB/CW tranceiver as a year long project this coming fall. I would appriciate any help with schematics and ideas from anyone. As of yet, the idea isn't final and therefore, the design specs aren't set into stone. Preliminary thoughts would lend me to think of a power out of about 20watts, full coverage with a PLL, multiple conversion reciever, adjustable audio/IF filters, possibly digital controls, etc. Much of the design can be pieced together from ARRL literature around the shack but any personal experiences are welcome. Thanks in advance.

73's de Zack, AA0XQ

Mike -

The apostrophe is being used as it is after the plural of an acronym, such as TV's, CD's, etc., where it is appropriate.

: filter out without affecting the low end of the band.

Can someone explain this? How can there be a carrier at 0Mhz, I thought
that the lowest frequency carrrier on fm-squared was like 150Khz or so.
Besides, if there were a carrier at 0, wouldn't the modulator just shift
it up to 100Mhz. If you tuned somewhere else than exactly 100Mhz (i.e.
102-103) on the FM receiver then you would block out the carrier at zero.

I'm looking for a dead or broken HF amp, RF deck, of the 8877 or 4CX1500B type(with or W/O tubes)
I don't need the power supply, but I must have a complete RF deck(no parts missing).
I'll give more for a unit with a good tube.
It must be cheap, apperance is unimportant(it can be very ugly).

HI;

Thanks for reading this.

I have the following stuff for sale or trade. I'm interested in mackine
tools dial meters calipers milling stuff or lathe accessories OR
blacksmithing stuff not to mention electronics stuff.If it says it works,
it works and I'll replace or refund your money at my option should you
have any problems with it. However, please don't buy something and
then decide you don't need or want it and expect me to take it
back. Also If something says 'cond unknown' that means I don't
know if it works or not. and I won't guarantee it. Its as is.
If the price says quan for x dollars that means I will not sell them
in single quantities. (I'm lazy).
Alot of these boards are pulls from a big computer place out here
that went belly up. From the stuff I've pulled out and tested,
it appears that they went out of business because they were
throwing away good cards.

CV89/Ura8a teletype decoder covers shift from 10 to 1000 hz.
freq from 595 to 1785 or external tone. in grey rack mount case

:The apostrophe is being used as it is after the plural of an acronym,
:such as TV's, CD's, etc., where it is appropriate.

:Dave

Forgive me for pointing out the obvious, but TV is the acronym for
TeleVision, CD is the acronym for Compact Disc, and 73 is the acronym for
71f2c87a 324dc87abff, which though not English is Universal Intergalactian
for "best regards," in the hexadecimal transliteration.

Similarly, 88 stands for 89ab3e41 8222ee1aa, "hugs and kisses," and
accordingly 88's is therefore entirely correct and appropriate. More
people should send the CORRECT forms over the airwaves on CW: "73's" not
just "73," but they don't stress the importance of the apostrophe in any
code course I've seen, so essentially noone does it on the air.

But YOU can make a difference!

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 + $10.00 s&h Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple controler w/id. You still need to provide a duplexer, and antenna. w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr + parts (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

The apostrophe is ok....but not for the reason stated below....the apostrophe
is appropriate to indicate omitted letters..... for example 73's ...I guess
you couldsay that 'three' or 'hree' are replaced by the apostrophe as an
abbreviation..another example plug 'n' pray..... 'a' and 'd' are replaced
by the apostrophes.However, many stores are guilty of putting the apostrophe
in a plural and this *is* incorrect.... cat's $1 tool's
$2 they incorrectly make thesewords possessive.

Hi,

I have the following items up for Best Offer:

1: Two sockets for the 4CX250's or 4CX150's
These were removed from a FM broacast Transmitter
which were manufactured by Gates/Harris. This
Xmitter was removed from service about six months
ago.

2: Two 4CX150's which were used in the above. The
Xmitter was ran at 200 watts and the tubes were
replaced ever 3 months.

If interested, sent e-mail to KJ4UO@AOL.COM

Thanks!

When the input signal to the converter is 0 MHz, the output is the
same frequency as the oscillator.
This is a nice way to check and set the local oscillator of the
upconverter.
Surely, the lowest usable input signal is about 150 Khz or so.

I second the idea of building the Sierra! It does require some
experience to build. The result is a radio that works and has
the few features one needs - small, multi-band, RIT when you want it,
good bandpass filter, ...

I added the frequency counter/keyer kit - it works very well.

Enjoy. N8TT

The kid (Shawn/Moe) has been pumping out tons of this stuff. (I counted 32 in the dozen or so electronics groups I read, in the last 6 days). Usually by spamming the same message to a bunch of newsgroups. They're all simple naive stuff, better answered by looking in a couple of magazines or books, or in this case a quick trip to the Yahoo web site.

>
>Peter

That's exactly right, Peter. Unfortunately, most of the few rigs
which do modulation at IF are multimodes whose receive filters
are too narrow to pass 9600 baud without unacceptable phase distortion.
(Most filters are very phase non-linear near the passband edges, so
you need a wider filter than the occupied bandwidth to avoid introducing
this distortion.)

James,

I don't see a conflict of interest here. Many lawyers represent competing companies. In fact, you generally seek a lawyer with experience in your industry.

The lawyer can never divulge information about one client to another, so he can't recommend actions to either about the other unless one client asks him to talk to the other. There is no conflict of interest unless one of his clients decides to take legal action against another and asks his advice. At that point, most lawyers tell both of their clients to hire another lawyer to handle that legal action.

Conflict of interest means that he is breaching confidentiality or using knowledge of one client to benefit the other. Just the suspicion of this can cause his clients to leave. Proof gets him disbarred. No wonder he is pissed off.

73,

John

Has anyone had much trouble with your TS930 or 940 blowing the two
MRF485 driver transistors? The circuit boards are the same between
the two radios.
Kenwood placed a 19.1 volt zenor diode (D5) in the base circuit of the
two drivers that should run no higher than .7vdc. Can't figure out
its true purpose. Any information is appreciated.

4728. strange 10m converted CB SSB RF problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-28 00:00:00 UTC
From: kenmccoy@aol.com
Message-ID: <4tg356$pp0@newsbf02.news.aol.com>
Source record: 103766

I recently picked up a Cobra SSB CB converted to 10m by HyStar, and I'm having trouble with RF output on the sidebands (AM is fine). When I turn up the power mic, I get output only when I speak. Receive is fine.

Is this normal for SSB? Shouldn't there be some kind of carrier to send unmodulated power to the antenna? I'm thinking the SSB filter circuitry is somehow not exactly tuned for 10m, thus making the power mic necessary?

I had a local QSO (4 miles) on SSB with a signal report of S-5 and the power mic turned up. I know the rig has 4W AM output, but I thought 25W was standard on SSB.

Anyone have any ideas?

Well, since you obviously decided to omit the authors of the various posts, you make it very hard to understand. I am responsible for that next-to-last paragraph, and as the poster before me brought up Part 15 and some non-existant regulation about "bypass", I was merely clarifying the point.

There are many in these newsgroups that fail (or just won't) see the difference between Amateur (Part 97) and Non-Amateur (Part 15) uses in the upper UHF 900 and 2400 MHz spectrum. This tends to confuse the poster - many of which (especially in the rec.radio.amateur.digital group) are not amateurs, but professionals just looking for information.

Their needs may be better served in the comp.std.wireless group, but for some reason, here is where they end up, having a number of people with their "you can't do that" messages quoting (and mis-quoting) Part 97 even though the poster had no reference or intention of using the Amateur bands in the beginning (or those that don't even bother to read the header, and the poster was operating in another regulatory environment to begin with).

Yes, that appears to be normal behaviour for a converted CB set. SSB transmitters remove everything except the one sideband that is to be transmitted before the signal is sent to the final power amplifier. With no audio input, you have no sidebands, and therefore no transmitted power.

The 4w output also doesn't surprise me. Most likely, the radio was simply retuned to transmit in the 10m band instead of the CB band. Changing the power output would also have required a considerable amount of tweaking, if not a complete replacement of the PA stages in the radio, something that would cost considerably more than a simple retuning, if it is practical to do at all.

If you want to get more power, your choices are essentially get a new radio, or get a linear amplifier to boost the power. I really don't see any alternatives that would be practical.

I would like to convert a Midland 13-386 from SSB to 10 meters.
(With luck, it will be finished before the sunspots return)
The conversion would be easier if I could find a SAMS Photofact
volume CB-64. If you have one you would sell, please let me know.
If you have one and you would be willing to xerox those pages,
I would pay for that. If know somebody that sells them, and they
still have this volume, that would be helpful. As a last resort,
if you simply want to give me a copy, I would be grateful.

Thordarson catalog number 610 list the 21P83 as having a secondary voltage
of 1250-0-1250, or 1560-0-1560. The catalog states "Secondary voltage may
be changed by primary tap. Either of the given voltages are available."
The secondary current rating is 200ma. It is 115vac primary. 73 Tom

> otherwise, tubes test ok and voltages are in the ballpark. Thanks.
>/John WB7SWB E-mail lroland@teleport.com
> Packet WB7SWB@W0RLI

What most S meters really read is the AGC voltage. If you switch
AGC off, then the meter doesn't read. (Adjusting manual RF gain,
which also manipulates AGC voltage, will cause the meter to read
upscale on these radios too.)

Of course AGC degrades the signal. It distorts the receiver's
dynamic range, and hence signal dynamics. That's its purpose.
You can have true dynamic range and fidelity with AGC off, or
you can have compressed dynamics with the AGC on. Your choice.
Only the former is linear. The latter is often desired, however,
when you have to deal with a mix of strong and weak signals on
a band. You have to live with the reduction in fidelity.

If the signals are *seriously* distorted, however, and not just
compressed, then the first RF stage may have a problem. Its bias
point may have shifted so that AGC drives it into cutoff. Make
sure you have the correct tube type in there. Often, remote
cutoff pentodes were used in tube receivers. Since some of those
are now rare, other tubes were substituted which didn't have a
remote cutoff characteristic. That can cause serious AGC problems.
Component aging can also shift the bias point.

4749. Schematic for S-meter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-29 00:00:00 UTC
From: alandp@flash.net
Message-ID: <4tiqvj$c6v@excelsior.flash.net>
Source record: 103692

Can anyone point me to a source for an S-meter
schematic? I'm building my first QRP kit and
I would eventually like to try adding an
S-meter to it if I can.

the legal limit for ssb for the CB was 12 watts so that is most likely
to be the power out put for the 10 meter band after the conversion.

A cable.... ;^)

> Obviously the level from the IRD is a volt or so, and the
> receiver wants microvolts.

Yes. You will need a attenuator pad betwixt them.

> Also, there is the issue of interference from
> such things as AM broadcast stations.

The signal levels are high enough so that cabling and impedance
match are not an issue. I never had any problems with
interference from AM/SW stations (and I lived in the shadow of a
50kW AM station *and* a 10kW SW station).

> Does anyone have suggestions for
> type of cable, attenuation method, etc. which can be used to connect the
> two together?

A hunk of RG-6, a -20 dB attenuator (if your communications
receiver does not have an input attenuator) and whatever adapters
are needed to get from the video output to the receivers input.

Radio Shack has an adjustable attenuator (#15-578) that should be
adequate.

Video out >>--------->> atten >>-------->> Receiver input

That's it!

(NOTE: If your TVRO receiver has a second "unfiltered" or
"unclamped" video output, use that one.)

it amazes me to see others past judgment, on others for the minor things in life. yes we should all spell correctly. however; how good are you in all other areas. are you so perfect that you are always correct and never make a mistake. have you ever given advise and then discovered you were wrong. some people spell better than others and others are better at other things. I know a very intelligent person with a masters degree but his spelling is very bad I guess in your eyes he should have never earned the degree. My spelling is bad also but mostly because of my hearing problem all my life, not discovered until late in life. He who is without sin cast the first stone !! Or maybe judge yourself before judging others. My uncle is worth a lot of money. Never finished elementary school he cant read or write but math is his forte. This is not directed at anyone but to those who are quick to judge.

This is totally normal for SSB. SSB is much more efficient than AM because of this. Instead of radiating a steady carrier as in AM, that carrier is supressed and only the modulated portion of the RF is transmitted. I am not familiear with the CB to 10M conversions but there should be some setting on the rig where the most power is put out without distorting and raditating unacceptable spurs. It seems like it is normal for CB to run a little more power on SSB than on AM (15 watts is what sticks in my mind) but I'm not sure of that.

Good luck.

<<<
Ideally SSB-transmitters should have no output at all without
modulation. Very little carrier (not visible on meter) is present.
The SSB-filter(s) is not operating on the output freqency (10m)
but on an intermediate fixed-freqency, and will normally not need
any retuning.Normal human voice has a low average power-
content with high and very short peaks. The power-rating of
a SSB-transmitter is usually given as PEP (peak envelope power)
and is the maximum power the transmitter will deliver without objec-
tionable distortion on these short peaks (not average).. Your output
meter is not fast enough to show these peaks, and will rather tend to
show the average- level. When You try to raise the average level by
using an amplified (power-) mic, there is a great risk that your
transmitter will overload on vcoice-peaks.- leading to what is called
splatter. This does not give you higher power, but simply spreads your
power out across the band, thus actually lowering your in-channel
useful power, and causing noise on adjacent channels. The exception is
if your power-mike has a well-designed compressor or clipper built
into it. Such circuits works by reducing the peak/average ratio of
your voice and thereby raise your average power. Bear in mind,
however, that this increases the load on your transmitter and leads to
much more heat generated in the circuits. Generally CB - units are not
designed to handle this safely....(own experience.....)

good luck and 73's from "Peter" LA7SL

4765. FS ~300 Watt amp. 20 to 80 MHz

I have an amplifier module that does about 300Watts output class AB from 20 to 80 MHz. The amplifier is designed for 48 Volts, but will work at reduced levels if powered with a lower voltage. It also requires a low current 12 volt supply for the biasing. It has 2 transistors and very nice input and output broadband transformers. Send me some e-mail if you need more info. This is a great amp module for a homebrew project.

Hi Nick;
Just happened to notice the thread on digital MW radio that you got started. Well, those guys really got quite far from the idea, which was a data link, not an R&D project. Not one of them mentioned the 22/23 GHz no-license band and surplus! Just so happens I have several sets of T1 digital links made by GE called GEMLINKS. Full duplex T1 capable, turn-key, integrated antenna/transceiver with indoor modem, like new in the box (actually, used by DOD-NSA for short term project and bought by me, surplus). Cost is 650.00 per set, and of course you will need two (one for each end). This avoids the problem with using 900/2400 MHz bands (very crowded, lots of EMI) and of using the Ham bands with all the Ham band issues. This band is made exactly for this purpose, the units have dishes (directional) and use low power (15 mW). The range is up to 10 km, so your link will be no problem. If you need more bandwidth, I have some 22 GHz systems by DMC that can handle 4 - T1, but these are more money.

Give me a call for more details - 410-461-5544

I'm building a 20M tranceiver with SSB/CW receiver. I'm looking at a dual conversion but am unsure of which IF's to use. I found a digital VFO to use with it which will tune from 0-10MHz with no problems and is capable ot tuning up to 20MHz. Considering availbility of filters and ease of contruction, what factors should be considered when selecting the IF?
Thanks.

Does anyone know where I can find an HSP45102PC-40 IC made by Harris Semiconductors. They call it a "12-bit numerically controlled oscillator IC." It basicially produces a digital sine wave to drive a DAC for DSS. Any help would be appriciated.

Thanks.

Is not the load of the class C PA an asymetrical load ? When the peak
voltage of the PA reaches the double of the Va, the power is the quadruple.
When the peak anode voltage go to zero, the power is zero too. Because
the modulator is usually a push-pull circuit, the one of the output
stage device will handle the high power half-wave, while the other device
will handle the low-power half-wave.

Which are the problems associated with this fact ? Can the load be
equilized between the two output devices (tubes or SS devices) ?

Having done the above, those of us that may not agree with the CW requirements do not, necessarily, want to trash all Amateur tradition.

In my opinoin, CW is the modern equivilant of spark transmission. It has no use other than pure enjoyment of those who like it. This is OK. There is no longer ANY commercial or military usage of CW. There will sonn be too few amateurs left who can copy it for it to be of any use in an emergency. Why shove it down everyone's throat when only a few actually enjoy it? How many Gerneral, Advanced, or Extra Class hams are there that can copy even 5 wpm any more?

Now that I have voiced my opinion, let me offer a solution. Keep the CW portions of the various bands for CW operators ONLY. Proficiency in CW must be demonstrated for thier usage. (An endorsement to the ticket perhaps?) Maintain the testing levels for the various classes of licences with stronger emphasis on theory, to replace the current code requirements. Add questions about operating courtesy (have you heard our glorified CB'ers on 20 meters recently?).

This solution is not what everyone would like, but I think it is a reasonable compromise.

Further discussion is welcome.

73,
Kevin N0OAS/AAR8GF

There are such things. Check Rockwell/Collin's www homepage. I can't recall the URL but do a search on AltaVista for Digital Radio Collins 95s.

The 95s is a direct conversion, dsp receiver that covers 50kc to 2ghz. The only RF stage is the front in amplifier/filter. Processing is done at 70mhz! There are no I.F. stages, just pure dsp all the way. For a mere $15,000 you receive the main circuit board and you must supply the rest. It is computer controlled too.

There are other dsp units available as you can see from the www search. Also, a lot of sat. receivers use a/d converters that run at 70mhz.

Hi there
Is there anyone who can help me figure out a problem concerning a design that I have seen in a book.You will need to have the book to help me.
The book is RF CIRCUIT DESIGN by CHRIS BOWICK.
On page 159 there is a diagram and design of a 15W 100MHz amplifier.
I understand the input and output matching that he has done,but where did he get the 310 ohm resistor and the 1uH coil that are connected to the collector of the transistor from.These are also in parallel with the output of the transistor and I would assume affect the matching network.These don't seem to have been taken into account.
Any help appreciated
Cheers
Robin

ARD is an excellent and very powerful program for *linear* RF/AF circuit
simulations. It has excellent graphics, optimizer, statistical analysis.
It requires some study and some experience to master it, but the effort
is worth while.

For nonlinear circuit analysis, consider as an adjunct a SPICE freeware
from the Websites.

I don't have the book in front of me, but I would opine that those
parts make up the shunt B+ feed for the stage. Their impedance should
be much higher than the output network's impedance at the amplifier's
design frequency (they should be about 1 kohm series), so they're
essentially invisible as far as matching is concerned (which should
be looking at a dynamic impedance on the order of 2 to 3 ohms). The
reason a resistor is used in the collector B+ circuit is to keep the
PEP collector voltage swing within the device ratings, IE if you ran
the collector directly off of 12 volts, the PEP swing might exceed
the transistor's breakdown rating.

That's just a guess of course since the circuit isn't in front of
me.

Let me strongly echo Bill's thoughts here. If you're modeling oscillators,
mixers, or demodulators, ARD isn't the tool of choice. It isn't even the
tool of choice for linear circuits where there's a possibility of their
being driven into a nonlinear region. And forget bias simulations. Use
SPICE for those things. Where ARD is strong is in modelling LC networks
and matching networks for linearly operated devices. Its report features
are extensive and useful. The tuning and optimization features are less
useful unless you have the patience of Job, or a screamingly fast machine.

Microsim has a Designer's Workbench that incorporates a schematic
entry front end for SPICE, and a Probe report generator which is
almost the equal of the one in ARD. Sadly, it, like ARD, requires
Windows (boo!). They have a crippleware evaluation version free
for downloading (it's on the QRZ CDROM too). Its worth a look.

There's also an X program which works under Linux that's worth a look.
It includes some CAD features as well as a graphically wrapped SPICE
engine. (And it's free too.) I don't recall its name, but I've seen it
run at a friend's house, and I'm going to get a copy for my machine
and give it a trial. More later on this.

>factors should be considered when selecting the IF?

The classic design uses a 9 MHz IF. This allows direct mixing with
a 5.0 to 5.5 MHz VFO for coverage of 75m and 20m (note tuning is
backwards on 75m and sidebands invert, this is the historical reason
why 75m uses LSB and 20m uses USB). The other bands are reached by a
second conversion from/to one of these bands via a crystal oscillator
and mixer (40m is converted from 76m and the other bands are converted
from 20m, hence why 40m also uses LSB while the others do not). For a
20m only design, you won't need that. This mixing scheme should be
birdie free on 20m, and a simple front end bandpass filter will stop
images.

9 MHz SSB/CW filters are available, IE KVG and others, inexpensively,
and so are the sideband crystals. Your DDS will have no trouble
serving as the VFO for this design (though you'll probably need
a clean up PLL to get rid of the DDS spurs).

The other classic IF, 10.7 MHz, isn't good for a SSB/CW receiver
since good narrow filters are hard to find. IF transformers for
this frequency, however, are common as dirt. So if you're going
to use a discrete IF strip, this might serve if a second conversion
down to 455 kHz were used. You can get the good Collins mechanical
filters for 455 kHz (actually 450 kHz). Converting directly to 455 kHz
from the operating frequency will have image problems on the upper
HF bands, such as 20m, unless you use a tracking preselector in the
front end, but double conversion dodges this problem.

The modern approach is to use an upconverting first IF in the
45 to 70 MHz range. Icom uses a 69 MHz first IF in their IC-706.
They then downconvert to 9 MHz for narrow filtering. (The plug
in filters sold as options for this rig are another convienent
source of 9 MHz IF filters.) Icom uses high side injection, IE
70-124 MHz, to cover the HF bands plus 6 meters. Your DDS won't
do this directly, but then the spurs of the DDS make it too
dirty to use directly anyway. You'll need a cleanup PLL on the
output of the DDS to get rid of the spurs, so you can add a
programable divider to the loop and have your high side injection
source. This can give you general coverage of HF, which is more
than you are asking for, but it comes essentially free with this

design. A simple roofing filter will handle the image problem,
and the scheme can be nearly birdie free if the lower IF is well
shielded (it will be birdie free on 20m).

If you triple convert any of the above approaches down to 85 kHz,
then you can use ganged ordinary LC tuned circuits for your narrow
filter. That's the approach Drake took with the 2B and R4 series.
The bonus is that you can have an infinitely variable passband.
The downside is considerable mechanical complexity, and almost
certain birdies somewhere in the tuning range of the radio if
you don't do *extensive* shielding of the lower IFs and oscillators.

Since you say you want to use double conversion, an approach which
will give you passband tuning is to use 9 MHz and 455 kHz IFs in
a novel way. First convert to 9 MHz and pass through a SSB filter,
then downconvert to 455 kHz using another VFO and mixer, filter at
455 kHz with another SSB filter, and convert *back* to 9 MHz using
another mixer and the *same* second VFO. Varying the second VFO,
which only covers a 3 kHz tuning range (a VXO will do nicely), causes
the passband of one filter to tune across the passband of the other.
This gives you an effectively infinitely variable passband too, but
without the mechanical complexity of the 2B's gang tuned LC circuits.

This is really slick, and avoids the need for switchable filters
to suit SSB or CW bandwidths (unless you are careful, the switching
circuitry can allow blowby of the narrower filter in that scheme).
When the filters are perfectly overlapped, you have excellent SSB
filtering characteristics, even if the individual filters aren't
that great. When narrowed by sliding the lower filter so that only
part of the passband is shared by the two filters, the skirts are
only as good as those of a single filter, but the ability to precisely
tailor the bandwidth usually makes up for that.

>equilized between the two output devices (tubes or SS devices) ?

It takes just as much modulator power to pull the output down as
to push it up, so the loads on the modulator devices are equal.
What isn't equal is the current in the secondary winding of the
modulation transformer. On positive modulation peaks, it is high,
as the modulator voltage adds to the PA power supply voltage, on
negative modulation peaks it is low, as the PA power supply voltage
is bucked by the modulator voltage. This can affect core saturation
design values, but unless the modulation transformer is allowed to
saturate (and it never should be allowed to saturate), the loads on
the push pull modulator devices will remain balanced as they
alternately buck and boost the PA power supply voltage (and hence
modulate PA current).

The fact that the PA is Class C, and asymmetric, is irrelevant
because that's at RF frequency and not AF frequency. At AF,
many many RF cycles pass for each AF cycle, so the load averages
out on the timescale the modulator tubes see. The modulation
transformer can be considered a smoothing choke to RF, so those
pulses the Class C stage draws are smoothed to an average value
as far as the modulator devices are concerned.

>hire another lawyer to handle that legal action.

I don't know where you get your information, but it is both uninformed and incorrect. The ABA Model Rules of Professional Conduct Sections 2.0-2.2 makes it quite clear that if two clients are adverse in an action, the lawyer cannot represent either, unless one gives the lawyer permission to represent the other.

>Conflict of interest means that he is breaching confidentiality or using
>knowledge of one client to benefit the other.

No, that's not what it means. It means that the lawyer cannot diligently represent one client without failing to diligenly represent the other. (My words, but that's the gist of it.)

>Just the suspicion of this
>can cause his clients to leave. Proof gets him disbarred. No wonder he is
>pissed off.

Wrong again. Disbarment is not always the sanction imposed on a lawyer who violates the rules. Sanctions usually are less severe, such as a public reprimand, or other punitive, non-disbarment stuff.

================ comments GM0CSZ / KN6WH
Herb,
Perhaps not for vernier dials/drives ,but a good address for
filiment and HT transformers ,High Voltage capacitors both for HV
rectification systems (oil filled) and RF ,vacuum capacitors , HV
rectifiers (diodes,bridge units), RF inductors,power resistors, vacuum relays,
tube sockets,transient suppressors,air variable capacitors ,a good
address is : Peter W Dahl & Co , 5869 Waycross Ave El Paso -TX 79924
phone (915) 751-2300 fax (915) 751 0768
They send a comprehensive catalogue

Another address is Surplus Sales Of Nebraska, 1502 Jones Street -Omaha,
Nebraska 68102-3112 , however beware : Their prices are often
somewhat shocking........

Frank Dinger , Inver by Tain , Ross-shire - Scotland UK

I have an older Radio Shack weather radio. It's crystal controlled, and it looks like it uses a single 16.202MHz crystal which I think is multiplied 10, and has a single 455kHz if (i think). Can I just replace the crystal to make a 2m rx? I just want a single frequency receiver that I can do a dtmf decode on to launch high power rockets. (the safe distance for some of the rockets we fly at our experimental launches is 1/2 mile to 1.5 miles, and yes do get FAA waivers, land owner permission, comply with ATF rules...). Will I need to adjust coils/inductors? Any suggestions on a crystal source?
Please reply here or to 150@westside.com

4793. WTD: Simple 50MHz tcvr kit

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-30 00:00:00 UTC
From: Martin Davies <Martin@amdavies.demon.co.uk>
Message-ID: <838757064snz@amdavies.demon.co.uk>
Source record: 103728

Does anyone in the USA know of any suppliers of kits for
building simple 50MHz SSB transceivers?

I'm a licensed Novice Instructor here in the UK and in the last
18 months I've coached six students through to pass the Novice
Radio Amateur Examination; this has enabled them all to obtain
Class B (VHF/UHF) Novice licences with 2E1 prefixes.

UK Novices are entitled to use the 6m band, and it occurs to me
that it would be better for my Novices to get to grips with a
decent band rather than starting on 70cms FM (2m isn't available
to them), just talking through repeaters. I feel it will give
them a better sense of achievement if they can make some 'DX'
contacts (at the right time of year and sunspot cycle!).
However, there is the major problem of an apparent lack of SSB
gear for 6m at affordable prices. All but one of my six Novices
are teenagers, so cost is an important factor in getting them
'on the air'. A target figure for a homebrew SSB QRP rig might
be under $200.

An alternative might be to build a simple 10m SSB transceiver
and also a 10m to 6m transverter - anyone got any suggestions on
suitable gear for this approach?

I'm sure there might be quite a decent market for a simple QRP
6m SSB rig, not only for Novices!

This kind of operation might be considered as RC model control which,
I believe, is only permitted on 6 meters with a 1W power restriction.

The RX mod you propose would probably work ok for 2M. Those receivers
are not very selective to begin with. You might not even have to
tune the front end.

>backwards on 75m and sidebands invert, this is the historical reason
>why 75m uses LSB and 20m uses USB).

Let's check that conventional wisdom about sideband inversion with a
thought experiment, an imaginary two-tone test with the VFO at 5.2 MHz.

IF
9000.0 kHz carrier
9000.8 kHz tone #1
9001.8 kHz tone #2
IF+VFO
14200.0 kHz carrier
14200.8 kHz tone #1
14201.8 kHz tone #2
IF-VFO
3800.0 kHz carrier
3800.8 kHz tone #1
3801.8 kHz tone #2

So the classic design does NOT invert sidebands.

A design which had both the sideband-inverting and backward-tuning
quirks was to use a converter from 75m to 20m with a high-side 18 MHz
crystal. To make things easier for the experimenter, he could start
with a 75m LSB rig. For that band, either an LSB-ladder filter made
from military surplus crystals or a 450 kHz Collins mechanical filter
would be adequate. Mix with an 80m VFO and he would be on the air.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I'm looking to purchase or build a "Y" adapter that will allow me to connect the mono audio out (headphone, 1/8") from a scanner and a SW receiver to one stereo headset.

My thought is to connect the SW receiver to the left channel of the headset and the scanner to the right channel, so as to listen to both audio's at once. Will this create any negative effects (feedback, etc.) to the headset or the receivers?

The "classic" design which does invert sidebands is a VFO in the 9.0-9.5MHz region with a home-made 5MHz filter using surplus FT243 crystals in cascaded half- or full lattices. These xtals were available in the 5MHz region, but not as high as 9MHz.

My first SSB rig was a Central Electronics 10A. This was a phasing rig
operating at 9 MHz with a 5 MHz VFO (usually a Command set BC4..something).

The filter rigs typically used MUCH lower IFs, 400 - 500 KHz for crystals, 20
- 50 KHz for LC filters.

I vote with Gary.

I've done this before and most times it seems to work quite well.
Sometimes it was two scanners, or SW and scanner, or whatever. Just a few
hints;
Make sure that the receiver playing in your left ear is physically
on your left and right on right. You'll have a tendency to turn
in the direction of the sound you hear.

Think about putting a momentary switch in a little box to open
either side, much easier than scrambling for the volume when you
want to listen to "one side" only. Locate these in the box
opposite the side they are wired to, that way you press the side
you want to hear and the other drops out.

Don't listen to static or hash for a long time, it's amazing how
deaf you become right after you take the headphones off.

I tend to use "ear-buds" since they let me hear more of the
ambient sounds around me. YMMV

Don't chew gum or walk while using this set-up, you could put your
eye out! :>

I guess this way you'll only have to spend half as much time to hear
everything you want. I did run into one individual who used to do this
but he was listen to four receivers and could keep up with our
conversation. As far as I know he's still doing it, buried in some
"magic-mountain" (tm) somewhere.

GA>...........
GA>Gary Coffman KE4ZV

Hi Gary.

I like to use a PNP power transistor to boost a common three terminal regulator. Connect about 10 ohms (1/2 watt or better) between emitter and base of the transistor. Connect the emitter to the unregulated input source. Connect the input of the three terminal regulator to the base. Connect the collector to the output of the regulator. Be sure to add your usual bypass caps as recommended for stability of the regulator. As the regulated circuit starts drawing current, voltage drop across the resistor starts to turn on the PNP transistor. As the load increases the transistor supplies the lion's share of the load current. The three terminal regulator never sees much more than 1/2 amp. Of course you can adjust the resistor to match the max current of smaller regulators too. I've used up to 27 ohms, use what you have.

The main advantage of this circuit over the driven NPN transistor is that the three terminal regulator is maintaining full regulation at the output. In your circuit the output voltage is less than the regulator voltage and can vary as the current changes. As you mentioned, using a boost transistor this way eliminates the over current shut down function of the regulator. The National data book mentioned the simple circuit and also had a more complex version that retained over current shut down. I've never bothered with the complex circuit, I use a fuse instead.

So the circuit you choose can be determined by what you have available in parts. Have a good day.

Conversion is trivial. Just change the crystals and repeak the PA.
No other mods are necessary.

Some military radio users do this sort of thing all the time, without
any problems. They also have a switch which enables them to transmit on
either of the nets they are monitoring.

Not sure if the <$200> was USD or GBP, but, the MFJ-9406X is USD $260 retail and about 10% less almost everywhere. Not a kit as far as I know but it would get them "on the air" which is the goal. I think it's about $10 less without the microphone.

Disclaimer: Just a happy MFJ cutomer who happened to have the AES catalog next to him when he read the post.

I've been looking endlessly for some cool amateur radio broadcasts (preferably live stuff) on the net. I realize the technology is still fairly expensive so it's hard for people to broadcast on RealAudio or Streamworks but I'm interested in hearing some stuff out there.

If you know of places where I can find this kind of live broadcast I'd really appreciate being pointed to it.

I've done countless searches and must be putting in the wrong key words.

Is anyone out there doing some amateur stuff or is it mostly the mainstream doing online live broadcasts?

Your help is appreciated

email to ao349@freenet.carleton.ca

Cheers!

From: xl3381@aol.com
Message-ID: <4toi4i$a7s@newsbf02.news.aol.com>
Source record: 103668

I had someone build an FM car diversity antenna which is not working properly. FYI, the theory behind the antenna is that there are two anntennas whose pilot subcarrier signal strengths are constantly compared and the circuit switches to the antenna with the best reception to reduce multipath interference. If anyone is interested in trouble shooting of this kind (in the Chicago area) I have a .gif of the schematic to send if you want to look it over. I'd be grateful for some help with this or any referals to someone else who would be!

4834. Frequency synth construction - Help wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-07-31 00:00:00 UTC
From: Alex Crow <101470.2134@CompuServe.COM>
Message-ID: <4tnun0svr1@mhadg.production.compuserve.com>
Source record: 103672

I was wondering if anyone knew about the MC145152P synth chip. I am considering building a huge project- a 150k to 30M gen cov RX. It is based on the Lowe HF125 with front end bandpass filters, full synthesis, 1st IF 45Mhz with 15kHz Xtal filter, 2nd IF 455kHz, all double-balanced mixers etc.
Is this chip easy to use? Is it simple to keep down the spurii without the use of a spectrum analyser? I know they always say 'don't build a synth without one' but surely a little over-engineering of the loop filter and care with keeping the capture ratio required low with help this? I have built single and multi band DC and superhet RXs before with good results, but would rather not shell out for an off-the-shelf gen cov, and I'd like the challenge!
Another question - is it better to match filters directly from the mixer using coils/tuned circuits or to use FET matching buffers???
Thanks in advance
Alex, Birmingham, UK

> > Try the ARRL Handbook.

Reminds me of a Navy instructor who when asked the same question about a Yagi, raised his eyebrows and dryly said " pretty good." 'Course the same guy,
a day or two before, enlightened us about the "1/4 wave ground plane" or the "Marconi whip" antenna. Seems Marconi had been working through a summer draught trying to prove a base fed 1/4 wave rod with it's insulated base stuck in the ground, would produce a nice 360 deg. toroidal radiation pattern. After a fruitless few days, Marconi threw up is hands and said "Aww piss on it". Well one of his grunts did just that and all of a sudden the antenna started working. And that's the honest to gosh beginning of all those little 1/4 wave whips you see on cars nowdays.

Hi Peter;
Read your inq. re 455 KHz filters, 500 Hz BW. If your friend does not turn any up, I have a pretty good selection of new Collins mechanical filters, including 455KHz C.F. types with 100, 200 and 500 Hz bandwidths. I get $75.00 ea. for the narrow bandwidth ones (1 KHz and down) and for ones >1 KHz and up, $60.00.

Jeff Kruth, WA3ZKR

4838. 148gtl 10 meter conversion

if you know where I can get
the plans for this, I would
be greatly appreciative.
thanks

Hello... could someone tell me were can i find the plans of
a Guaranty 4000 CB Radio ? I would like to convert it to 10 meters
operation...

Answers in this group or slug@cygnus.ci.uc.pt

bye

>for some of the rockets we fly at our experimental launches is 1/2 mile to
>1.5 miles, and yes do get FAA waivers, land owner permission, comply with
>ATF rules...). Will I need to adjust coils/inductors? Any suggestions on
>a crystal source?

Yes, you'll need to modify the front end inductorsi (add turns). They
won't come all the way down to 2m with just tweaking. (Alternately, you
can add padder capacitance to bring the radio down in frequency.)

The radio isn't very high performance, of course. Nor is it even slightly
secure. I'd want something a bit better to control pyrotechnics. At the
very least I'd require CTCSS on the link so that Joe HT won't inadvertently
fire the thing while you're hooking it up.

Gary

John,

There is a fine set of plans in: "Transmitter Hunting:Radio Direction Finding Simplified" by Moell and Curlee TAB Books ISBN 0-8306-2701-4 Starting on P179.

You might also like to check out the classical filter reference by Anitol Zverev and a fine (if not a little technical) book by Peter Vizmuller (ISBN 0-89006-244-7).

Enjoy,

Mark, VE2HVW
